(54) Title: STRESS-REGULATED GENES OF PLANTS, TRANSGENIC PLANTS CONTAINING SAME, AND METHODS OF USE

(57) Abstract: The present invention relates to clusters of plant genes that are regulated in response to one or more stress conditions. The present invention also relates to isolated plant stress-regulated genes, including portions thereof comprising a coding sequence or a regulatory element, and to consensus sequences comprising a plant stress-regulated regulatory element. In addition, the invention relates to a recombinant polynucleotide, which includes a plant stress-regulated gene, or functional portion thereof, operatively linked to a heterologous nucleotide sequence. The invention further relates to a transgenic plant, which contains a plant stress-regulated gene or functional portion thereof that was introduced into a progenitor cell of the plant. In addition, the invention relates to methods of using a plant stress-regulated gene to confer upon a plant a selective advantage to a stress condition. The invention also relates to a method of identifying an agent that modulates the activity of a plant stress-regulated regulatory element.

WO 02/016655 A2

**STRESS-REGULATED GENES OF PLANTS, TRANSGENIC PLANTS
CONTAINING SAME, AND METHODS OF USE**

BACKGROUND OF THE INVENTION

FIELD OF THE INVENTION

The present invention relates generally to plant genes, the expression of which are regulated in response to stress, and more specifically to the gene regulatory elements involved in a stress-induced response in plants, to uses of the coding sequences and regulatory elements of such plant stress-regulated genes, and to transgenic plants
5 genetically modified to express such a coding sequence or to express a heterologous polynucleotide from such a regulatory element.

BACKGROUND INFORMATION

Microarray technology is a powerful tool that can be used to identify the
10 presence and level of expression of a large number of polynucleotides in a single assay. A microarray is formed by linking a large number of discrete polynucleotide sequences, for example, a population of polynucleotides representative of a genome of an organism, to a solid support such as a microchip, glass slide, or the like, in a defined pattern. By contacting the microarray with a nucleic acid sample obtained
15 from a cell of interest, and detecting those polynucleotides expressed in the cell can hybridize specifically to complementary sequences on the chip, the pattern formed by the hybridizing polynucleotides allows the identification of clusters of genes that are expressed in the cell. Furthermore, where each polynucleotide linked to the solid support is known, the identity of the hybridizing sequences from the nucleic acid
20 sample can be identified.

A strength of microarray technology is that it allows the identification of differential gene expression simply by comparing patterns of hybridization. For example, by comparing the hybridization pattern of nucleic acid molecules obtained from cells of an individual suffering from a disease with the nucleic acids obtained
25 from the corresponding cells of a healthy individual, genes that are differentially expressed can be identified. The identification of such differentially expressed genes

provides a means to identify new genes, and can provide insight as to the etiology of a disease.

Microarray technology has been widely used to identify patterns of gene expression associated with particular stages of development or of disease conditions in animal model systems, and is being applied to the identification of specific patterns of gene expression in humans. The recent availability of information for the genomes of plants provides a means to adapt microarray technology to the study of plant gene expression.

Plants and plant products provide the primary sustenance, either directly or indirectly, for all animal life, including humans. For the majority of the world's human population and for many animals, plants and plant products provide the sole source of nutrition. As the world population increases, the best hope to prevent widespread famine is to increase the quantity and improve the quality of food crops, and to make the crops available to the regions of the world most in need of food.

Throughout history, a continual effort has been made to increase the yield and nutritious value of food crops. For centuries, plants having desirable characteristics such as greater resistance to drought conditions or increased size of fruit were crossbred and progeny plants exhibiting the desired characteristics were selected and used to produce seed or cuttings for propagation. Using such classical genetic methods, plants having, for example, greater disease resistance, increased yield, and better flavor have been obtained. The identification of plant genes involved in conferring a selective advantage on the plant to an environmental challenge would facilitate the generation and yield of plants, thereby increasing the available food supply to an increasing world population. The involvement of these genes in a single organism to responses to multiple stress conditions, however, remains unknown. Thus, a need exists to identify plant genes and polynucleotides that are involved in modulating the response of a plant to changing environmental conditions. The present invention satisfies this need and provides additional advantages.

30

SUMMARY OF THE INVENTION

The present invention relates to clusters of genes that are regulated in response to a stress condition in plants. Such clusters include, for example, plant polynucleotides

whose expression is altered in response to two or more different stress conditions; and plant polynucleotides the expression of which are altered in response to one stress condition, but not to others. The identification of such clusters, using microarray technology, has allowed the identification of plant stress-regulated genes in
5 *Arabidopsis thaliana* (see Tables 1 and 2); and homologs and orthologs thereof in other plant species (see Table 32). Thus, the invention provides isolated polynucleotide portions of *Arabidopsis* plant stress-regulated genes, and homologs and orthologs thereof; variants of such sequences, and polynucleotides encoding substantially similar plant stress-regulated polypeptides expressed therefrom. Such sequences include, for
10 example, sequences encoding transcription factors; enzymes, including kinases; and structural proteins, including channel proteins (see Tables 29-31). Accordingly, the present invention also relates to an isolated polynucleotide comprising all or a portion of a plant stress-regulated gene, and to polynucleotide portions thereof, including a coding region (open reading frame), which encodes all or a portion of a stress-
15 regulated polypeptide, for example, as set forth in SEQ ID NOS:1-2703; and a regulatory element involved in regulating the response of the plant to a stress condition such exposure to an abnormal level of salt, osmotic pressure, temperature or any combination thereof, for example, as set forth in SEQ ID NOS:2704-5379.

The present invention also relates to a recombinant polynucleotide, which
20 contains a nucleotide sequence of a plant stress-regulated gene or functional portion thereof operatively linked to a heterologous nucleotide sequence. In one embodiment, the recombinant polynucleotide comprises a plant stress-regulated gene regulatory element operatively linked to a heterologous nucleotide sequence, which is not regulated by the regulatory element in a naturally occurring plant. The heterologous
25 nucleotide sequence, when expressed from the regulatory element, can confer a desirable phenotype to a plant cell containing the recombinant polynucleotide. In another embodiment, the recombinant polynucleotide comprises a coding region, or portion thereof, of a plant stress-regulated gene operatively linked to a heterologous promoter. The heterologous promoter provides a means to express an encoded stress-
30 regulated polypeptide constitutively, or in a tissue-specific or phase-specific manner.

Accordingly, in one aspect, the present invention provides an isolated polynucleotide comprising a nucleotide sequence of a plant gene that hybridizes under

stringent conditions, preferably high stringency conditions, to any one of SEQ ID NOS:1-5379 (see Tables 1 and 2), including to a coding region (SEQ ID NOS:1-2703) or a regulatory region, which can alter transcription of an operatively linked nucleic acid sequence in response to an abiotic stress (SEQ ID NOS:2704-5379; see Table 2), or to a complement thereof. Additional aspects provide sequences that hybridize under stringent conditions, preferably high stringency conditions, to the complements of SEQ ID NO 1-1261 (cold responsive genes; Tables 3-6), SEQ ID NOS:2227-2427 (saline responsive genes; Tables 7-10), SEQ ID NOS:2428-2585 (osmotic responsive genes; Tables 11-14), SEQ ID NOS:1699-1969 (cold and osmotic responsive genes; Tables 15-17), SEQ ID NOS:1970-2226 (cold and saline responsive genes; Tables 18-20), SEQ ID NOS:2586-2703 (osmotic and saline responsive genes; Tables 21-23), and SEQ ID NOS:1262-1698(cold, osmotic and saline responsive genes; Tables 24-26), and which can comprise regulatory regions that can alter transcription in response to cold stress, osmotic stress, saline stress, or combinations thereof (SEQ ID NOS:2704-5379; see Table 2). Also provided are nucleotide sequences complementary thereto, and expression cassettes, plants and seeds comprising any of the above isolated sequences.

In another aspect, the present invention provides an isolated polynucleotide comprising a plant nucleotide sequence that hybridizes under stringent conditions, preferably high stringency conditions, to the complement of any one of SEQ ID NOS:1-2703 (Table 1), including to a coding region thereof (SEQ ID NOS:2704-5379), wherein expression of said coding region is altered in response to an abiotic stress. Additional aspects provide sequences that hybridize under high stringency conditions to the complements of SEQ ID NO 1-1261 (cold responsive genes; Tables 3-6), SEQ ID NOS:2227-2427 (saline responsive genes; Tables 7-10), SEQ ID NOS:2428-2585 (osmotic responsive genes; Tables 11-14), SEQ ID NOS:1699-1969 (cold and osmotic responsive genes; Tables 15-17), SEQ ID NOS:1970-2226 (cold and saline responsive genes; Tables 18-20), SEQ ID NOS:2586-2703 (osmotic and saline responsive genes; Tables 21-23), and SEQ ID NOS:1262-1698(cold, osmotic and saline responsive genes; Tables 24-26), and which can comprise a coding region whose transcription is altered in response to cold stress, osmotic stress, saline stress, or a combination thereof. Also provided are nucleotide

sequences complementary thereto, and expression cassettes, plants and seeds comprising any of the above sequences.

The invention further relates to a method of producing a transgenic plant, which comprises at least one plant cell that exhibits altered responsiveness to a stress condition.

5 In one embodiment, the method can be performed by introducing a polynucleotide portion of plant stress-regulated gene into a plant cell genome, whereby the polynucleotide portion of the plant stress-regulated gene modulates a response of the plant cell to a stress condition.

The polynucleotide portion of the plant stress-regulated gene can encode a
10 stress-regulated polypeptide or functional peptide portion thereof (see SEQ ID NOS:1-2703), wherein expression of the stress-regulated polypeptide or functional peptide portion thereof either increases the stress tolerance of the transgenic plant, or decreases the stress tolerance of the transgenic plant. The polynucleotide portion of the plant stress-regulated gene encoding the stress-regulated polypeptide or functional
15 peptide portion thereof can be operatively linked to a heterologous promoter. The polynucleotide portion of the plant stress-regulated gene also can comprise a stress-regulated gene regulatory element (see SEQ ID NOS:2704-5379). The stress-regulated gene regulatory element can integrate into the plant cell genome in a site-specific manner, whereupon it can be operatively linked to a heterologous nucleotide
20 sequence, which can be expressed in response to a stress condition specific for the regulatory element; or can be a mutant regulatory element, which is not responsive to the stress condition, whereby upon integrating into the plant cell genome, the mutant regulatory element disrupts an endogenous stress-regulated regulatory element of a plant stress-regulated gene, thereby altering the responsiveness of the plant stress-
25 regulated gene to the stress condition.

In one aspect, the invention provides a method for producing a transgenic plant by introducing into at least one plant cell a recombinant nucleic acid construct comprising i) all or a portion of any one of SEQ ID NOS:1-5379; ii) a polynucleotide comprising a coding region that hybridizes under conditions of high stringency to all
30 or a portion of the complement of any one of SEQ ID NOS:1-2703; iii) a polynucleotide comprising a sequence that alters transcription of an operatively linked coding region in response to abiotic stress, and that hybridizes under conditions of

high stringency to the complement of any one of SEQ ID NOS:2704-5379; iv) a polynucleotide having at least 90% sequence identity with any one of SEQ ID NO:1-5379; v) a fragment of any one of the sequences of iv), wherein the fragment comprises a coding region; or vi) a fragment of any one of the sequences of iv),
5 wherein the fragment comprises a nucleotide sequence that alters transcription of an operatively linked coding region in response to abiotic stress; and regenerating a plant from the at least one plant cell.

Another aspect provides a method for producing a transgenic plant comprising introducing into at least one plant cell a recombinant nucleic acid construct
10 comprising i) any one of SEQ ID NOS:1-1261 or 2704-3955; ii) a polynucleotide comprising a coding region that hybridizes under conditions of high stringency to the complement of any one of SEQ ID NOS:1-1261; iii) a polynucleotide comprising a sequence that alters transcription of an operatively linked coding region in response to cold stress that hybridizes under conditions of high stringency to the complement of
15 any one of SEQ ID NOS:2704-3955; iv) a polynucleotide that has at least 90% sequence identity with any one of SEQ ID NOS:1-1261 or 2704-3955; v) a fragment of any one of the sequences of iv), wherein the fragment comprises a coding region; or vi) a fragment of any one of the sequences of iv) wherein the fragment comprises a sequence or region that alters transcription of an operatively linked
20 coding region in response to cold stress; and regenerating a plant from the at least one plant cell.

In another aspect, the invention provides a method for producing a transgenic plant by introducing into at least one plant cell a recombinant nucleic acid construct comprising i) any one of SEQ ID NOS:2428-2585 or 5108-5263; ii) a
25 polynucleotide comprising a coding region that hybridizes under conditions of high stringency to the complement of any one of SEQ ID NOS:2428-2585; iii) a polynucleotide comprising a sequence that alters transcription of an operatively linked coding region in response to osmotic stress that hybridizes under conditions of high stringency to the complement of any one of SEQ ID NOS:5108-5263; iv) a
30 polynucleotide that has at least 90% sequence identity with any one of SEQ ID NOS:2428-2585 or 5108-5263; v) a fragment of any one of the sequences of iv), wherein the fragment comprises a coding region; or vi) a fragment of any one of the

sequences of iv), wherein the fragment comprises a sequence or region that alters transcription of an operatively linked coding region in response to osmotic stress; and regenerating a plant from the at least one plant cell.

Still another aspect provides a method for producing a transgenic plant
5 comprising introducing into at least one plant cell a recombinant nucleic acid
construct comprising i) any one of SEQ ID NOS:2227-2427 or 4910-5107; ii) a
polynucleotide comprising a coding region that hybridizes under conditions of high
stringency to the complement of any one of SEQ ID NOS:2227-2427; iii) a
polynucleotide comprising a sequence that alters transcription of an operatively linked
10 coding region in response to saline stress that hybridizes under conditions of high
stringency to the complement of any one of SEQ ID NOS:2227-2427; iv) a
polynucleotide that has at least 90% sequence identity with any one of SEQ ID
NOS:4910-5107; v) a fragment of any one of the sequences of iv), wherein the
fragment comprises a coding region; or vi) a fragment of any one of the sequences of
15 iv) wherein the fragment comprises a sequence or region that alters transcription of an
operatively linked coding region in response to saline stress; and regenerating a plant
from the at least one plant cell.

Yet another aspect provides a method for producing a transgenic plant
comprising introducing into at least one plant cell a recombinant nucleic acid
20 construct comprising i) any one of SEQ ID NOS:1699-1969 or 4389-4654; ii) a
polynucleotide comprising a coding region that hybridizes under conditions of high
stringency to the complement of any one of SEQ ID NOS:1699-1969; iii) a
polynucleotide comprising a sequence that alters transcription of an operatively linked
coding region in response to a combination of cold and osmotic stress that hybridizes
25 under conditions of high stringency to the complement of any one of SEQ ID
NOS:4389-4654; iv) a polynucleotide that has at least 90% sequence identity with any
one of SEQ ID NOS:1699-1969 or 4389-4654; v) a fragment of any one of the
sequences of iv), wherein the fragment comprises a coding region; or vi) a fragment
of any one of the sequences of iv), wherein the fragment comprises a sequence or
30 region that alters transcription of an operatively linked coding region in response to a
combination of cold and osmotic stress; and regenerating a plant from the at least one
plant cell.

Yet another aspect provides a method for producing a transgenic plant comprising introducing into at least one plant cell a recombinant nucleic acid construct comprising i) any one of SEQ ID NOS:1970-2226 or 4655-4909; ii) a polynucleotide comprising a coding region that hybridizes under conditions of high stringency to the complement of any one of SEQ ID NOS:1970-2226; iii) a polynucleotide comprising a sequence that alters transcription of an operatively linked coding region in response to a combination of cold and saline stress that hybridizes under conditions of high stringency to the complement of any one of SEQ ID NOS:4655-4909; iv) a polynucleotide that has at least 90% sequence identity with any one of SEQ ID NOS:1970-2226 or 4655-4909; v) a fragment of any one of the sequences of iv), wherein the fragment comprises a coding region; or vi) a fragment of any one of the sequences of iv), wherein the fragment comprises a sequence or region that alters transcription of an operatively linked coding region in response to a combination of cold and saline stress; and regenerating a plant from the at least one plant cell.

A further aspect provides a method for producing a transgenic plant comprising introducing into at least one plant cell a recombinant nucleic acid construct comprising i) any one of SEQ ID NOS:2586-2703 or 5264-5379; ii) a polynucleotide comprising a coding region that hybridizes under conditions of high stringency to the complement of any one of SEQ ID NOS:2586-2703; iii) a polynucleotide comprising a sequence that alters transcription of an operatively linked coding region in response to a combination of osmotic and saline stress that hybridizes under conditions of high stringency to the complement of any one of SEQ ID NOS: 5264-5379; iv) a polynucleotide that has at least 90% sequence identity with any one of SEQ ID NOS:2586-2703 or 5264-5379; v) a fragment of any one of the sequences of iv), wherein the fragment comprises a coding region; or vi) a fragment of any one of the sequences of iv), wherein the fragment comprises a sequence or region that alters transcription of an operatively linked coding region in response to a combination of osmotic and saline stress; and regenerating a plant from the at least one plant cell.

Another aspect provides a method for producing a transgenic plant comprising introducing into at least one plant cell a recombinant nucleic acid construct

comprising i) any one of SEQ ID NOS:1262-1698 or 3956-4388; ii) a polynucleotide comprising a coding region that hybridizes under conditions of high stringency to the complement of any one of SEQ ID NOS:1262-1698; iii) a polynucleotide comprising a sequence that alters transcription of an operatively linked coding region in response to a combination of cold, osmotic and saline stress that hybridizes under conditions of high stringency to the complement of any one of SEQ ID NOS:3956-4388; iv) a polynucleotide that has at least 90% sequence identity with any one of SEQ ID NOS:1262-1698 or 3956-4388; v) a fragment of any one of the sequences of iv), wherein the fragment comprises a coding region; or vi) a fragment of any one of the sequences of iv) wherein the fragment comprises a sequence or region that alters transcription of an operatively linked coding region in response to a combination of cold, osmotic and saline stress; and regenerating a plant from the at least one plant cell. Further aspects include plants and uniform populations of plants made by the above methods as well as seeds and progeny from such plants.

In another embodiment, a transgene introduced into a plant cell according to a method of the invention can encode a polypeptide that regulates expression from an endogenous plant stress-regulated gene. Such a polypeptide can be, for example, a recombinantly produced polypeptide comprising a zinc finger domain, which is specific for the regulatory element, and an effector domain, which can be a repressor domain or an activator domain. The polynucleotide encoding the recombinant polypeptide can be operatively linked to and expressed from a constitutively active, inducible or tissue specific or phase specific regulatory element. Expression of the recombinant polypeptide from a plant stress-regulated promoter as disclosed herein can be particularly advantageous in that the polypeptide can be coordinately expressed with the endogenous plant stress-regulated genes upon exposure to a stress condition. The invention also provides transgenic plants produced by a method as disclosed, as well as to a plant cell obtained from such transgenic plant, wherein said plant cell exhibits altered responsiveness to the stress condition; a seed produced by the transgenic plant; and a cDNA or genomic DNA library prepared from the transgenic plant, or from a plant cell from said transgenic plant, wherein said plant cell exhibits altered responsiveness to the stress condition.

In one aspect, the invention provides an isolated nucleic acid molecule comprising a nucleotide sequence substantially similar to a sequence of any one of SEQ ID NOS:2704-5379, which can alter transcription of an operatively linked polynucleotide in a plant cell in response to an abiotic stress. Additional aspects of the invention provide isolated polynucleotides, including, for example, sequences substantially similar to any of SEQ ID NOS:2704-3955, which can alter transcription of an operatively linked polynucleotide in response to a cold stress; isolated polynucleotides substantially similar to a sequence of any of SEQ ID NOS:5108-5263, which can alter transcription of an operatively linked polynucleotide in response to an osmotic stress; isolated polynucleotides substantially similar to a sequence of any of SEQ ID NOS:4910-5107, which can alter transcription of an operatively linked polynucleotide in response to a saline stress; isolated polynucleotides substantially similar to a sequence of any of SEQ ID NOS:4389-4654, which can alter transcription of an operatively linked polynucleotide in response to a combination of cold and osmotic stresses; isolated polynucleotides substantially similar to a sequence of any of SEQ ID NOS:4655-4909, which can alter transcription of an operatively linked polynucleotide in response to a combination of cold and saline stresses; isolated polynucleotides substantially similar to a sequence of any of SEQ ID NOS:5264-5379, which can alter transcription of an operatively linked polynucleotide in response to a combination of osmotic and saline stresses; and isolated polynucleotides substantially similar to a sequence of any of SEQ ID NOS:3956-4388, which can alter transcription of an operatively linked polynucleotide in response to a combination of cold, osmotic and saline stresses.

Related aspects of the invention provide an isolated nucleotide sequences that can alter transcription of an operatively linked polynucleotide in response to an abiotic stress, and that hybridize under stringent conditions, preferably highly stringent conditions, to the complement of any one of SEQ ID NOS:2704-5379. Additional aspects provide an isolated nucleotide sequence that can alter transcription of an operatively linked polynucleotide in response to cold stress, and that hybridizes under stringent conditions, preferably highly stringent conditions, to the complement of any one of SEQ ID NOS:2704-3955; a nucleotide sequence that alters transcription of an operatively linked polynucleotide in response to osmotic stress, and that

hybridizes under stringent conditions, preferably highly stringent conditions, to the complement of any one of SEQ ID NOS:5108-5263; a nucleotide sequence that alters transcription of an operatively linked polynucleotide in response to saline stress, and that hybridizes under stringent conditions, preferably highly stringent conditions, to the complement of any one of SEQ ID NOS:4910-5107; a nucleotide sequence that alters transcription of an operatively linked polynucleotide in response to a combination of cold and osmotic stress, and that hybridizes under stringent conditions, preferably highly stringent conditions, to the complement of any one of SEQ ID NOS:4389-4654; a nucleotide sequence that alters transcription of an operatively linked polynucleotide in response to a combination of cold and saline stress, and that hybridizes under stringent conditions, preferably highly stringent conditions, to the complement of any one of SEQ ID NOS:4655-4909; a nucleotide sequence that alters transcription of an operatively linked polynucleotide in response to an combination of osmotic and saline stress, and that hybridizes under stringent conditions, preferably highly stringent conditions, to the complement of any one of SEQ ID NOS:5264-5379; and a nucleotide sequence that alters transcription of an operatively linked polynucleotide in response to a combination of cold, osmotic and saline stress, and that hybridizes under stringent conditions, preferably highly stringent conditions, to the complement of any one of SEQ ID NOS:3956-4388.

Further aspects provide an expression cassette comprising as operatively linked components any of the above isolated nucleic acid sequences that alter transcription, a coding region, and a termination sequence. Also provided are host cells and seeds comprising such expression cassettes, plants containing such host cells and seeds and progeny of plants containing said host cells. In related aspects, the coding region of the expression cassettes comprise sequences encoding marker proteins and sequences involved in gene silencing such as antisense sequences, double stranded RNAi sequences, a triplexing agent, and sequences comprising dominant negative mutations. In additional related aspects, the coding regions comprise sequences encoding polypeptides that alter the response of a plant to an abiotic stress.

The present invention also relates to a method of modulating the responsiveness of a plant cell to a stress condition. Such a method can be performed, for example, by introducing a polynucleotide portion of a plant stress-regulated genes

described herein into the plant cell, thereby modulating the responsiveness of the plant cell to a stress condition. Such a method can result in the responsiveness of the plant cell being increased upon exposure to the stress condition, which, in turn, can result in increased or decreased tolerance of the plant cell to a stress condition; or can
5 result in the responsiveness of the plant cell to the stress condition being decreased, which, in turn, can result in increased or decreased tolerance of the plant cell to a stress condition. In one embodiment, the polynucleotide portion of the plant stress-regulated gene can integrate into the genome of the plant cell, thereby modulating the responsiveness of the plant cell to the stress condition. In another embodiment, the
10 polynucleotide portion of the plant stress-regulated gene encodes a stress-regulated polypeptide or functional peptide portion thereof, and can be operatively linked to a heterologous promoter. The polynucleotide portion of the plant stress-regulated gene also can contain a mutation, whereby upon integrating into the plant cell genome, the polynucleotide disrupts (knocks-out) an endogenous plant stress-regulated sequence,
15 thereby modulating the responsiveness of the plant cell to the stress condition. Depending on whether the knocked-out gene encodes an adaptive or a maladaptive stress-regulated polypeptide, the responsiveness of the plant will be modulated accordingly. In still another embodiment, the polynucleotide portion of the plant stress-regulated gene can comprise a stress-regulated regulatory element, which can
20 be operatively linked to a heterologous nucleotide sequence, the expression of which can modulate the responsiveness of the plant cell to a stress condition. Such a heterologous nucleotide sequence can encode, for example, a stress-inducible transcription factor such as DREB1A. The heterologous nucleotide sequence also can encode a polynucleotide that is specific for a plant stress-regulated gene, for example,
25 an antisense molecule, an RNAi molecule, a ribozyme, and a triplexing agent, any of which, upon expression in the plant cell, reduces or inhibits expression of a stress-regulated polypeptide encoded by the gene, thereby modulating the responsiveness of the plant cell to a stress condition, for example, an abnormal level of cold, osmotic pressure, and salinity. Accordingly, the invention also relates to a plant cell obtained
30 by such a method, and to a plant comprising such a plant cell.

The present invention also relates to a method of expressing a heterologous nucleotide sequence in a plant cell. Such a method can be performed, for example, by

introducing into the plant cell a plant stress-regulated regulatory element operatively linked to the heterologous nucleotide sequence, whereby, upon exposure of the plant cell to a stress condition, the heterologous nucleotide sequence is expressed in the plant cell. In a preferred embodiment, the stress regulated element is any of the sequences described herein that are capable of altering transcription of an operatively linked sequence in response to an abiotic stress, for example, SEQ ID NOS:2704-5379. The heterologous nucleotide sequence can encode a selectable marker, a diagnostic marker, or a polypeptide that confers a desirable trait upon the plant cell, for example, a polypeptide that improves the nutritional value, digestibility or ornamental value of the plant cell, or a plant comprising the plant cell.

The present invention further relates to a method of modulating the activity of a biological pathway in a plant cell, wherein the pathway involves a stress-regulated polypeptide or a non-protein regulatory molecule. Such a method can be performed by introducing a polynucleotide portion of a plant stress-regulated gene, or a polynucleotide derived therefrom, for example a ribozyme derived from a nucleotide sequence as set forth in any of SEQ ID NOS:1-2703, into the plant cell, thereby modulating the activity of the biological pathway. The method can be performed with respect to a pathway involving any of the stress-regulated polypeptides as disclosed herein or encoded by the polynucleotides disclosed herein, as well as using homologs or orthologs thereof.

The present invention also relates to a method of identifying a polynucleotide that modulates a stress response in a plant cell. In one embodiment the method comprises determining gene expression in a plant exposed to at least one stress to produce an expression profile and identifying sequences whose expression is altered at least two fold compared to plants not exposed to the stress. Such an expression profile can be obtained, for example, by contacting an array of probes representative of a plant cell genome with nucleic acid molecules expressed in a plant cell exposed to the stress; and detecting one or more nucleic acid molecules expressed at a level different from a level of expression in the absence of the stress. The method can further comprise introducing the differentially expressed nucleic acid molecule into a plant cell; and detecting a modulated response of the genetically modified plant cell to a stress, thereby identifying a polynucleotide that modulates a stress response in a

plant cell. The stress can be any stress, for example, an abiotic stress such as exposure to an abnormal level of cold, osmotic pressure, and salinity. The contacting is under conditions that allow for selective hybridization of a nucleic acid molecule with probe having sufficient complementarity, for example, under stringent hybridization conditions. Expression of the nucleic acid molecule can increase or decrease the tolerance of the plant cell to the stress, and the nucleic acid molecule can be expressed at a level that is less than or greater than the level of expression in the absence of the stress.

The present invention additionally relates to a method of identifying a stress condition to which a plant cell was exposed by comparing an expression profile from a test plant suspected of having been exposed to at least one stress condition to an expression profile obtained from a reference plant, preferably of the same species, which has been exposed to the suspected stress condition. Such a method can be performed, for example, by contacting nucleic acid molecules expressed in the test plant cell with an array of probes representative of the plant cell genome; detecting a profile of expressed nucleic acid molecules characteristic of a stress response, and comparing the expression pattern in the test plant to the expression pattern obtained from a reference plant thereby identifying the stress condition to which the plant cell was exposed. The contacting is under conditions that allow for selective hybridization of a nucleic acid molecule with probes having sufficient complementarity, for example, under stringent hybridization conditions. The profile can be characteristic of exposure to a single stress condition, for example, an abnormal level of cold, osmotic pressure, or salinity, or can be characteristic of exposure to more than one stress condition, for example, cold, increased osmotic pressure and increased salinity. In one embodiment, the nucleotide sequence of a gene whose expression is detected is selected from a polynucleotide comprising any of SEQ ID NOS:1-2703. In further embodiments, the nucleotide sequence of a gene that is expressed in response a particular stress or combination of stresses can comprise a polynucleotide expressed in response to cold stress (SEQ ID NOS:1-1261), osmotic stress (SEQ ID NOS:2428-2585), saline (salt) stress (SEQ ID NOS:2227-2427), a combination of cold and osmotic stress (SEQ ID NOS:1699-1969), a combination of saline and osmotic stress (SEQ ID NOS:1970-

2226), a combination of osmotic and saline stress (SEQ ID NOS:2586-2703), or a combination of cold, osmotic and saline stress (SEQ ID NOS:1262-1698).

The present invention further relates to a transgenic plant, which contains a nucleic acid construct comprising a polynucleotide portion of plant stress-regulated polynucleotide. In one embodiment, the transgenic plant exhibits altered responsiveness to a stress condition as compared to a corresponding reference plant not containing the construct. Such a transgenic plant can contain, for example, a construct that disrupts an endogenous stress-regulated gene in the plant, thereby reducing or inhibiting expression of the gene in response to a stress condition. Such a knock-out can increase or decrease tolerance of the plant to a stress condition. The transgene also can comprise a coding sequence of a plant stress-regulated gene, which can be operatively linked to a heterologous regulatory element such as a constitutively active regulatory element, an regulated regulatory element, a tissues specific or phase specific regulatory element, or the like. In another embodiment, the transgenic plant contains a nucleic acid construct comprising a plant stress-regulated regulatory element, which can be operatively linked to a heterologous nucleotide sequence that can encode a polypeptide. Expression of the heterologous polypeptide can confer a desirable characteristic on the plant, for example, can improve the nutritional or ornamental value of the transgenic plant. In still another embodiment, the transgenic plant contains multiple nucleic acid constructs, which can be multiple copies of the same construct, or can be two or more different constructs.

The present invention also relates to a plant stress-regulated regulatory element, which is obtained from a plant stress-regulated polynucleotide disclosed herein for example any of SEQ ID NOS:2704-5379; a homolog or ortholog thereof. The invention also provides a method of identifying an agent, for example a transcription factor, that specifically binds to or activates a plant stress-regulated regulatory element. Such a method can be performed, for example, by contacting the regulatory element with a plant cell extract, and identifying polypeptides that specifically bind to the regulatory element. Confirmation that the specifically binding polypeptide is a transcription factor can be demonstrated using, for example, the stress-regulated regulatory element operably linked to a reporter gene, and detecting expression of the reporter gene. Control constructs comprising a regulatory element, other than a plant stress-regulated regulatory element, operatively linked to a reporter molecule can be used to confirm

that the transcription factor is specific for the plant stress-regulated regulatory element. A polynucleotide encoding such a transcription factor also can be obtained.

The present invention also relates to a method of using a polynucleotide portion of a plant stress-regulated gene to confer a selective advantage on a plant cell.

5 In one embodiment, such a method is performed by introducing a plant stress-regulated regulatory element into a plant cell such as those described herein, wherein, upon exposure of the plant cell to a stress condition to which the regulatory element is responsive, a nucleotide sequence operatively linked to the regulatory element is expressed, thereby conferring a selective advantage to plant cell. The operatively
10 linked nucleotide sequence can be, for example, a transcription factor, the expression of which induces the further expression of polynucleotides involved in a stress response, thereby enhancing the response of a plant to the stress condition. In another embodiment, a coding sequence of a plant stress-regulated gene as disclosed herein is introduced into the cell, thereby providing the plant with a selective advantage in
15 response to a stress condition. In still another embodiment, the method results in the knock-out of a plant stress-regulated gene as disclosed herein in a first population of plants, thereby providing a selective advantage to a stress condition in a second population of plants.

The invention further relates to a method of identifying an agent that
20 modulates the activity of a stress-regulated regulatory element of a plant. In a particular embodiment, is provided a method for identifying an agent that alters the activity of an abiotic stress responsive regulatory element comprising contacting the agent or a composition containing an agent to be tested with at least one abiotic stress responsive regulatory element, preferably selected from the group consisting of SEQ
25 ID NOS:2704-5379 (see Table 2), and determining the effect of the agent on the ability of the regulatory sequence to regulate transcription. In further embodiments, the regulatory elements are associated with particular stresses or combination of stresses such as cold stress (SEQ ID NOS:2704-3955), osmotic stress (SEQ ID NOS:5108-5263), saline stress (SEQ ID NOS:4910-5107), a combination of cold and
30 osmotic stress (SEQ ID NOS:4389-4654), a combination of cold and saline stress (SEQ ID NOS:4655-4909), a combination of osmotic and saline stress (SEQ ID NOS:5264-5379), or a combination of cold, osmotic and saline stress (SEQ ID

NOS:3956-4388). In one embodiment, the regulatory element can be operatively linked to a heterologous polynucleotide encoding a reporter molecule, and an agent that modulates the activity of the stress-regulated regulatory element can be identified by detecting a change in expression of the reporter molecule due to contacting the regulatory element with the agent. Such a method can be performed *in vitro* in a plant cell-free system, or in a plant cell in culture or in a plant *in situ*. In another embodiment, the agent is contacted with a transgenic plant containing an introduced plant stress-regulated regulatory element, and an agent that modulates the activity of the regulatory element is identified by detecting a phenotypic change in the transgenic plant. The methods of the invention can be performed in the presence or absence of the stress condition to which the particularly regulatory element is responsive.

Another aspect provides a method for identifying an agent that alters abiotic stress responsive polynucleotide expression in a plant or plant cell comprising contacting a plant or plant cell with a test agent; subjecting the plant cell or plant cell to an abiotic stress or combination of stresses before, during or after contact with the agent to be tested; obtaining an expression profile of the plant or plant cell and comparing the expression profile of the plant or plant cell to an expression profile from a plant or plant cell not exposed to the abiotic stress or combination of stresses. In one embodiment, the expression profile comprises expression data for at least one nucleotide sequence comprising any of SEQ ID NOS:1-5379 (see Tables 1 and 2). In additional embodiments, the expression profile comprises expression data for at least one, and preferably two or more sequences associated with a particular abiotic stress or combination of stresses such as cold stress (SEQ ID NOS:1-1261 and 2704-3955), osmotic stress (SEQ ID NOS:2428-2585 and 5108-5263), saline stress (SEQ ID NOS:2227-2427 and 4910-5107), a combination of cold and osmotic stress (SEQ ID NOS:1699-1969 and 4389-4654), a combination of cold and saline stress (SEQ ID NOS:1970-2226 and 4655-4909), a combination of osmotic and saline stress (SEQ ID NOS:2586-2703 and 5264-5379), or a combination of cold, osmotic and saline stress (SEQ ID NOS:1262-1698 and 3956-4388).

Still another aspect provides nucleotide probes useful for detecting an abiotic stress response in plants, the probes comprising a nucleotide sequence of at least 15, 25, 50 or 100 nucleotides that hybridizes under stringent, preferably highly stringent,

conditions to at least one sequence comprising any of SEQ ID NOS:1-2703. Also provided are nucleotide probes comprising at least 15, 25, 50 or 100 nucleotides in length that hybridize under stringent, preferably highly stringent conditions, to at least one gene associated with a particular stress or combination of stresses, for example cold stress, (SEQ ID NOS:1-1261), osmotic stress (SEQ ID NOS:2428-2585), saline stress (SEQ ID NOS:2227-2427), a combination of cold and osmotic stress (SEQ ID NOS:1699-1969), a combination of cold and saline stress (SEQ ID NOS:1970-2226), a combination of osmotic and saline stress (SEQ ID NOS:2586-2703), or a combination of cold, osmotic, and saline stress (SEQ ID NOS:1262-1698).

An additional aspect provides a method for marker-assisted breeding to select plants having an altered resistance to abiotic stress comprising obtaining nucleic acid molecules from the plants to be selected; contacting the nucleic acid molecules with one or more probes that selectively hybridize under stringent, preferably highly stringent, conditions to a nucleic acid sequence selected from the group consisting of SEQ ID NOS:1-2703; detecting the hybridization of the one or more probes to the nucleic acid sequences wherein the presence of the hybridization indicates the presence of a gene associated with altered resistance to abiotic stress; and selecting plants on the basis of the presence or absence of such hybridization. Marker-assisted selection can also be accomplished using one or more probes which selectively hybridize under stringent, preferably highly stringent conditions, to a nucleotide sequence comprising a polynucleotide expressed in response associated with a particular stress, for example, a nucleotide sequence comprising any of SEQ ID NOS:1-1261 (cold stress), SEQ ID NOS:2428-2585 (osmotic stress), SEQ ID NOS:2227-2427 (saline stress), SEQ ID NOS:1699-1969 (cold and osmotic stress), SEQ ID NOS:1970-2226 (cold and saline stress), SEQ ID NOS:2586-2703 (osmotic and saline stress), or SEQ ID NOS:1262-1698 (cold, osmotic and saline stress). In each case marker-assisted selection can be accomplished using a probe or probes to a single sequence or multiple sequences. If multiple sequences are used they can be used simultaneously or sequentially.

A further aspect provides a method for monitoring a population of plants comprising providing at least one sentinel plant containing a recombinant polynucleotide comprising a stress responsive regulatory sequence selected from the

group consisting of SEQ ID NOS:2704-5379 which is operatively linked to a nucleotide sequence encoding a detectable marker, for example a fluorescent protein. Additional aspects provide the use of various regulatory sequences including those associated with cold stress (SEQ ID NOS:2704-3955), osmotic stress (SEQ ID
5 NOS:5108-5263), saline stress (SEQ ID NOS:4910-5107), cold and osmotic stress (SEQ ID NOS:4389-4654), cold and saline stress (SEQ ID NOS:4655-4909), osmotic and saline stress (SEQ ID NOS:5264-5379), and cold, osmotic and saline stress (SEQ ID NOS:3956-4388), or fragments thereof wherein such fragments can alter transcription of an operatively linked nucleotide sequence in response to an abiotic
10 stress.

A further aspect provides a computer readable medium having stored thereon computer executable instructions for performing a method comprising receiving data on gene expression in a test plant of at least one nucleic acid molecule having at least 70%, preferably at least 80%, more preferably at least 90%, and most preferably at
15 least 95% nucleotide sequence identity to one or more polynucleotide sequences as set forth in any of SEQ ID NOS:1-2703; and comparing expression data from the test plant to expression data for the same polynucleotide sequence or sequences in a plant that has been exposed to at least one abiotic stress.

Yet a further aspect provides a computer readable medium having stored
20 thereon a data structure comprising, sequence data for at least one, and preferably a plurality of nucleic acid molecules having at least 70%, preferably at least 80%, more preferably at least 90%, and most preferably at least 95% nucleotide sequence identity to a polynucleotide comprising any of SEQ ID NOS:1-2703, or the complement thereof; and a module receiving the nucleic acid molecule sequence data which
25 compares the nucleic acid molecule sequence data to at least one other nucleic acid sequence.

DETAILED DESCRIPTION OF THE INVENTION

The present invention relates to clusters of genes that are induced in response to one or a combination of abiotic stress conditions. Abiotic stress conditions, such as a
30 shortage or excess of solar energy, water and nutrients, and salinity, high and low temperature, or pollution (e.g., heavy metals), can have a major impact on plant growth and can significantly reduce the yield, for example, of cultivars. Under

conditions of abiotic stress, the growth of plant cells is inhibited by arresting the cell cycle in late G1, before DNA synthesis, or at the G2/M boundary (see Dudits, Plant Cell Division, Portland Press Research, Monograph; Francis, Dudits, and Inze, eds., 1997; chap. 2, page 21; Bergounioux, Protoplasma 142:127-136, 1988). The
5 identification of stress-regulated gene clusters, using microarray technology, provides a means to identify plant stress-regulated genes.

As used herein, the term "cluster," when used in reference to stress-regulated genes, refers to nucleotide sequences of genes that have been selected by drawing Venn diagrams, and selecting those genes that are regulated only by a selected stress condition.
10 In general, a cluster of stress-regulated genes includes at least 5, 10, 15, or 20 genes, including polynucleotide portions thereof, each of which is responsive to the same selected stress condition or conditions. The selected stress condition can be a single stress condition, for example, cold, osmotic stress or salinity stress (see Tables 3-14), or can be a selected combination of stress conditions, for example, cold, osmotic stress and
15 salinity stress (see Tables 15-26). In addition, a cluster can be selected based on specifying that all of the genes are coordinately regulated, for example, they all start at a low level and are induced to a higher level. However, a cluster of saline stress-regulated genes, for example, that was selected for coordinate regulation from low to high, also can be decreased in response to cold or mannitol. By varying the parameters used for
20 selecting a cluster of gene nucleotide sequences, those genes that are expressed in a specific manner following a stress can be identified.

As used herein in reference to a polynucleotide or polynucleotide portion of a gene or nucleic acid molecule, the term "isolated" means a polynucleotide, polynucleotide portion of a gene, or nucleic acid molecule that is free of one or both
25 of the nucleotide sequences that normally flank the polynucleotide in a genome of a naturally-occurring organism from which the polynucleotide is derived. The term includes, for example, a polynucleotide or fragment thereof that is incorporated into a vector or expression cassette; into an autonomously replicating plasmid or virus; into the genomic DNA of a prokaryote or eukaryote; or that exists as a separate molecule
30 independent of other polynucleotides. It also includes a recombinant polynucleotide that is part of a hybrid polynucleotide, for example, one encoding a polypeptide sequence.

The terms "polynucleotide," "oligonucleotide," and "nucleic acid sequence" are used interchangeably herein to refer to a polymeric (2 or more monomers) form of nucleotides of any length, either ribonucleotides or deoxyribonucleotides. Although nucleotides are usually joined by phosphodiester linkages, the term also includes
5 polymers containing neutral amide backbone linkages composed of aminoethyl glycine units. The terms are used only to refer to the primary structure of the molecule. Thus, the term includes double stranded and single stranded DNA molecules, including a sense strand or an antisense strand, and RNA molecules as well as genomic DNA, cDNA, mRNA and the like. It will be recognized that such
10 polynucleotides can be modified, for example, by including a label such as a radioactive, fluorescent or other tag, by methylation, by the inclusion of a cap structure, by containing a substitution of one or more of the naturally occurring nucleotides with a nucleotide analog, by containing an internucleotide modification such as having uncharged linkages (e.g., methyl phosphonates, phosphotriesters,
15 phosphoramidates, carbamates, or the like), by containing a pendant moiety such as a protein (e.g., a nuclease, toxin, antibody, signal peptide, poly-L-lysine, or the like), by containing an intercalator such as acridine or psoralen, by containing a chelator, which can be a metal such as boron, an oxidative metal, or a radioactive metal, by containing an alkylator, or by having a modified linkage (e.g., an alpha anomeric
20 nucleic acid).

The term "recombinant nucleic acid molecule" refers to a polynucleotide produced by human intervention. A recombinant nucleic acid molecule can contain two or more nucleotide sequences that are linked in a manner such that the product is not found in a cell in nature. In particular, the two or more nucleotide sequences can
25 be operatively linked and, for example, can encode a fusion polypeptide, or can comprise a nucleotide sequence and a regulatory element. A recombinant nucleic acid molecule also can be based on, but different, from a naturally occurring polynucleotide, for example, a polynucleotide having one or more nucleotide changes such that a first codon, which normally is found in the polynucleotide, is replaced
30 with a degenerate codon that encodes the same or a conservative amino acid, or such that a sequence of interest is introduced into the polynucleotide, for example, a

restriction endonuclease recognition site or a splice site, a promoter, a DNA replication initiation site, or the like.

As used herein, the term "abiotic stress" or "abiotic stress condition" refers to the exposure of a plant, plant cell, or the like, to a non-living ("abiotic") physical or chemical agent or condition that has an adverse effect on metabolism, growth, development, propagation and/or survival of the plant (collectively "growth"). An abiotic stress can be imposed on a plant due, for example, to an environmental factor such as water (e.g., flooding, drought, dehydration), anaerobic conditions (e.g., a low level of oxygen), abnormal osmotic conditions, salinity or temperature (e.g., hot/heat, cold, freezing, frost), a deficiency of nutrients or exposure to pollutants, or by a hormone, second messenger or other molecule. Anaerobic stress, for example, is due to a reduction in oxygen levels (hypoxia or anoxia) sufficient to produce a stress response. A flooding stress can be due to prolonged or transient immersion of a plant, plant part, tissue or isolated cell in a liquid medium such as occurs during monsoon, wet season, flash flooding or excessive irrigation of plants, or the like. A cold stress or heat stress can occur due to a decrease or increase, respectively, in the temperature from the optimum range of growth temperatures for a particular plant species. Such optimum growth temperature ranges are readily determined or known to those skilled in the art. Dehydration stress can be induced by the loss of water, reduced turgor, or reduced water content of a cell, tissue, organ or whole plant. Drought stress can be induced by or associated with the deprivation of water or reduced supply of water to a cell, tissue, organ or organism. Saline stress (salt stress) can be associated with or induced by a perturbation in the osmotic potential of the intracellular or extracellular environment of a cell. Osmotic stress also can be associated with or induced by a change, for example, in the concentration of molecules in the intracellular or extracellular environment of a plant cell, particularly where the molecules cannot be partitioned across the plant cell membrane.

As disclosed herein, clusters of plant stress-regulated genes (Example 1; see, also, Tables 1-31) and homologs and orthologs thereof (Table 32) have been identified. Remarkably, several of the stress-regulated genes previously were known to encode polypeptides having defined cellular functions, including roles as transcription factors, enzymes such as kinases, and structural proteins such as channel proteins (see

Tables 29-31). The identification of *Arabidopsis* stress-regulated genes provides a means to identify homologous and orthologous genes and gene sequences in other plant species using well known procedures and algorithms based on identity (or homology) to the disclosed sequences. Thus, the invention provides polynucleotide sequences comprising plant stress-regulated genes that are homologs or orthologs, variants, or otherwise substantially similar to the polynucleotides disclosed herein, and having an E value $\leq 1 \times 10^{-8}$, which can be identified, for example, by a BLASTN search using the *Arabidopsis* polynucleotides of Tables 1 and 2 (SEQ ID NOS:1-5379) as query sequences (see Table 32).

A polynucleotide sequence of a stress-regulated gene as disclosed herein can be particularly useful for performing the methods of the invention on a variety of plants, including but not limited to, corn (*Zea mays*), *Brassica* sp. (e.g., *B. napus*, *B. rapa*, *B. juncea*), particularly those *Brassica* species useful as sources of seed oil, alfalfa (*Medicago sativa*), rice (*Oryza sativa*), rye (*Secale cereale*), sorghum (*Sorghum bicolor*, *Sorghum vulgare*), millet (e.g., pearl millet (*Pennisetum glaucum*), proso millet (*Panicum miliaceum*), foxtail millet (*Setaria italica*), finger millet (*Eleusine coracana*)), sunflower (*Helianthus annuus*), safflower (*Carthamus tinctorius*), wheat (*Triticum aestivum*), soybean (*Glycine max*), tobacco (*Nicotiana tabacum*), potato (*Solanum tuberosum*), peanuts (*Arachis hypogaea*), cotton (*Gossypium barbadense*, *Gossypium hirsutum*), sweet potato (*Ipomoea batatas*), cassava (*Manihot esculenta*), coffee (*Cofea* spp.), coconut (*Cocos nucifera*), pineapple (*Ananas comosus*), citrus trees (*Citrus* spp.), cocoa (*Theobroma cacao*), tea (*Camellia sinensis*), banana (*Musa* spp.), avocado (*Persea utilane*), fig (*Ficus casica*), guava (*Psidium guajava*), mango (*Mangifera indica*), olive (*Olea europaea*), papaya (*Carica papaya*), cashew (*Anacardium occidentale*), macadamia (*Macadamia integrifolia*), almond (*Prunus amygdalus*), sugar beets (*Beta vulgaris*), sugarcane (*Saccharum* spp.), oats, duckweed (*Lemna*), barley, tomatoes (*Lycopersicon esculentum*), lettuce (e.g., *Lactuca sativa*), green beans (*Phaseolus vulgaris*), lima beans (*Phaseolus limensis*), peas (*Lathyrus* spp.), and members of the genus *Cucumis* such as cucumber (*C. sativus*), cantaloupe (*C. cantalupensis*), and musk melon (*C. melo*). Ornamentals such as azalea (*Rhododendron* spp.), hydrangea (*Macrophylla hydrangea*), hibiscus (*Hibiscus rosasanensis*), roses (*Rosa* spp.), tulips (*Tulipa* spp.),

daffodils (*Narcissus* spp.), petunias (*Petunia hybrida*), carnation (*Dianthus caryophyllus*), poinsettia (*Euphorbia pulcherrima*), and chrysanthemum are also included. Additional ornamentals within the scope of the invention include impatiens, Begonia, Pelargonium, Viola, Cyclamen, Verbena, Vinca, Tagetes, Primula, Saint
 5 Paulia, Agertum, Amaranthus, Antihirrhinum, Aquilegia, Cineraria, Clover, Cosmo, Cowpea, Dahlia, Datura, Delphinium, Gerbera, Gladiolus, Gloxinia, Hippeastrum, Mesembryanthemum, Salpiglossos, and Zinnia. Conifers that may be employed in practicing the present invention include, for example, pines such as loblolly pine (*Pinus taeda*), slash pine (*Pinus elliotii*), ponderosa pine (*Pinus ponderosa*),
 10 lodgepole pine (*Pinus contorta*), and Monterey pine (*Pinus radiata*), Douglas-fir (*Pseudotsuga menziesii*); Western hemlock (*Tsuga ultilane*); Sitka spruce (*Picea glauca*); redwood (*Sequoia sempervirens*); true firs such as silver fir (*Abies amabilis*) and balsam fir (*Abies balsamea*); and cedars such as Western red cedar (*Thuja plicata*) and Alaska yellow-cedar (*Chamaecyparis nootkatensis*).

15 Leguminous plants which may be used in the practice of the present invention include beans and peas. Beans include guar, locust bean, fenugreek, soybean, garden beans, cowpea, mung bean, lima bean, fava bean, lentils, chickpea, etc. Legumes include, but are not limited to, *Arachis*, e.g., peanuts, *Vicia*, e.g., crown vetch, hairy vetch, adzuki bean, mung bean, and chickpea, *Lupinus*, e.g., lupine, trifolium,
 20 *Phaseolus*, e.g., common bean and lima bean, *Pisum*, e.g., field bean, *Melilotus*, e.g., clover, *Medicago*, e.g., alfalfa, Lotus, e.g., trefoil, lens, e.g., lentil, and false indigo. Preferred forage and turf grass for use in the methods of the invention include alfalfa, orchard grass, tall fescue, perennial ryegrass, creeping bent grass, and redtop.

Other plants within the scope of the invention include *Acacia*, aneth,
 25 artichoke, arugula, blackberry, canola, cilantro, clementines, escarole, eucalyptus, fennel, grapefruit, honey dew, jicama, kiwifruit, lemon, lime, mushroom, nut, okra, orange, parsley, persimmon, plantain, pomegranate, poplar, radiata pine, radicchio, Southern pine, sweetgum, tangerine, triticale, vine, yams, apple, pear, quince, cherry, apricot, melon, hemp, buckwheat, grape, raspberry, chenopodium, blueberry,
 30 nectarine, peach, plum, strawberry, watermelon, eggplant, pepper, cauliflower, Brassica, e.g., broccoli, cabbage, ultilan sprouts, onion, carrot, leek, beet, broad bean,

celery, radish, pumpkin, endive, gourd, garlic, snapbean, spinach, squash, turnip, ultilane, chicory, groundnut and zucchini.

As used herein, the term "substantially similar", when used herein with respect to a nucleotide sequence, means a nucleotide sequence corresponding to a reference
5 nucleotide sequence, wherein the corresponding sequence encodes a polypeptide or comprises a regulatory element having substantially the same structure and function as the polypeptide encoded by the reference nucleotide sequence, for example, where only changes in amino acids not affecting the polypeptide function occur. For purposes of the present invention, a reference (or query) sequence is a polynucleotide
10 sequence as set forth in any of SEQ ID NOS:1-2703 or a polypeptide encoded thereby. Desirably, a substantially similar nucleotide sequence encodes the polypeptide encoded by the reference nucleotide sequence. The percentage of identity between the substantially similar nucleotide sequence and the reference nucleotide sequence desirably is at least 60%, more desirably at least 75%, preferably at least
15 90%, more preferably at least 95%, still more preferably at least 99% and including 100%. A nucleotide sequence is "substantially similar" to reference nucleotide sequence hybridizes to the reference nucleotide sequence in 7% sodium dodecyl sulfate (SDS), 0.5 M NaPO₄, 1 mM EDTA at 50°C with washing in 2X SSC, 0.1% SDS at 50°C, more desirably in 7% sodium dodecyl sulfate (SDS),
20 0.5 M NaPO₄, 1 mM EDTA at 50°C with washing in 1X SSC, 0.1% SDS at 50°C (stringent conditions), more desirably still in 7% sodium dodecyl sulfate (SDS), 0.5 M NaPO₄, 1 mM EDTA at 50°C with washing in 0.5X SSC, 0.1% SDS at 50°C (high stringency), preferably in 7% sodium dodecyl sulfate (SDS), 0.5 M NaPO₄, 1 mM EDTA at 50°C with washing in 0.1X SSC, 0.1% SDS at 50°C (very high
25 stringency), more preferably in 7% sodium dodecyl sulfate (SDS), 0.5 M NaPO₄, 1 mM EDTA at 50°C with washing in 0.1X SSC, 0.1% SDS at 65°C (extremely high stringency).

In addition, the term "substantially similar," when used in reference to a polypeptide sequence, means that an amino acid sequence relative to a reference (query)
30 sequence shares at least about 65% amino acid sequence identity, particularly at least about 75% amino acid sequence identity, and preferably at least about 85%, more

preferably at least about 90% , and most preferably at least about 95% or greater amino acid sequence identity. Generally, sequences having an $E \leq 10^{-8}$ are considered to be substantially similar to a query sequence. Such sequence identity can take into account conservative amino acid changes that do not substantially affect the function of a polypeptide. As such, homologs or orthologs of the *Arabidopsis* stress-regulated nucleotide sequences disclosed herein, variants thereof, and polypeptides substantially similar to the polynucleotide sequence of *Arabidopsis* stress-regulated genes set forth in SEQ ID NOS:1-5379 are encompassed within the present invention and, therefore, useful for practicing the methods of the invention (see, for example, Table 32).

Homology or identity is often measured using sequence analysis software such as the Sequence Analysis Software Package of the Genetics Computer Group (University of Wisconsin Biotechnology Center, 1710 University Avenue, Madison, WI 53705). Such software matches similar sequences by assigning degrees of homology to various deletions, substitutions and other modifications. The terms "homology" and "identity," when used herein in the context of two or more nucleic acids or polypeptide sequences, refer to two or more sequences or subsequences that are the same or have a specified percentage of amino acid residues or of nucleotides that are the same when compared and aligned for maximum correspondence over a comparison window or designated region as measured using any number of sequence comparison algorithms or by manual alignment and visual inspection.

For sequence comparison, typically one sequence acts as a reference sequence, to which test sequences are compared. When using a sequence comparison algorithm, test and reference sequences are entered into a computer, subsequence coordinates are designated, if necessary, and sequence algorithm program parameters are designated. Default program parameters can be used, or alternative parameters can be designated. The sequence comparison algorithm then calculates the percent sequence identities for the test sequences relative to the reference sequence, based on the program parameters.

The term "comparison window" is used broadly herein to include reference to a segment of any one of the number of contiguous positions, for example, about 20 to 600 positions, for example, amino acid or nucleotide position, usually about 50 to about 200 positions, more usually about 100 to about 150 positions, in which a sequence may be compared to a reference sequence of the same number of contiguous positions

after the two sequences are optimally aligned. Methods of alignment of sequence for comparison are well-known in the art. Optimal alignment of sequences for comparison can be conducted, for example, by the local homology algorithm of Smith and Waterman (Adv. Appl. Math. 2:482, 1981), by the homology alignment algorithm of Needleman and Wunsch (J. Mol. Biol. 48:443, 1970), by the search for similarity method of Person and Lipman (Proc. Natl. Acad. Sci., USA 85:2444, 1988), each of which is incorporated herein by reference; by computerized implementations of these algorithms (GAP, BESTFIT, FASTA, and TFASTA in the Wisconsin Genetics Software Package, Genetics Computer Group, 575 Science Dr., Madison, WI); or by manual alignment and visual inspection. Other algorithms for determining homology or identity include, for example, in addition to a BLAST program (Basic Local Alignment Search Tool at the National Center for Biological Information), ALIGN, AMAS (Analysis of Multiply Aligned Sequences), AMPS (Protein Multiple Sequence Alignment), ASSET (Aligned Segment Statistical Evaluation Tool), BANDS, BESTSCOR, BIOSCAN (Biological Sequence Comparative Analysis Node), BLIMPS (BLOCKS IMPROVED Searcher), FASTA, Intervals & Points, BMB, CLUSTAL V, CLUSTAL W, CONSENSUS, LCONSENSUS, WCONSENSUS, Smith-Waterman algorithm, DARWIN, Las Vegas algorithm, FNAT (Forced Nucleotide Alignment Tool), Framealign, Framesearch, DYNAMIC, FILTER, FSAP (Fristensky Sequence Analysis Package), GAP (Global Alignment Program), GENAL, GIBBS, GenQuest, ISSC (Sensitive Sequence Comparison), LALIGN (Local Sequence Alignment), LCP (Local Content Program), MACAW (Multiple Alignment Construction & Analysis Workbench), MAP (Multiple Alignment Program), MBLKP, MBLKN, PIMA (Pattern-Induced Multi-sequence Alignment), SAGA (Sequence Alignment by Genetic Algorithm) and WHAT-IF. Such alignment programs can also be used to screen genome databases to identify polynucleotide sequences having substantially identical sequences.

A number of genome databases are available for comparison. Several databases containing genomic information annotated with some functional information are maintained by different organizations, and are accessible via the internet, for example, at world wide web addresses (url's) "www.tigr.org/tdb"; "genetics.wisc.edu";

"genome-www.stanford.edu/~ball"; "hiv-web.lanl.gov"; "ncbi.nlm.nih.gov"; "ebi.ac.uk"; "Pasteur.fr/other/biology"; and "genome.wi.mit.edu".

In particular, the BLAST and BLAST 2.0 algorithms using default parameters are particularly useful for identifying polynucleotide and polypeptides encompassed within the present invention (Altschul et al. (Nucleic Acids Res. 25:3389-3402, 1977; 5 J. Mol. Biol. 215:403-410, 1990, each of which is incorporated herein by reference). Software for performing BLAST analyses is publicly available through the National Center for Biotechnology Information (<http://www.ncbi.nlm.nih.gov>). This algorithm involves first identifying high scoring sequence pairs (HSPs) by identifying short words of length W in the query sequence, which either match or satisfy some positive-valued 10 threshold score T when aligned with a word of the same length in a database sequence. T is referred to as the neighborhood word score threshold (Altschul et al., *supra*, 1977, 1990). These initial neighborhood word hits act as seeds for initiating searches to find longer HSPs containing them. The word hits are extended in both directions along each 15 sequence for as far as the cumulative alignment score can be increased. Cumulative scores are calculated using, for nucleotide sequences, the parameters M (reward score for a pair of matching residues; always >0). For amino acid sequences, a scoring matrix is used to calculate the cumulative score. Extension of the word hits in each direction are halted when: the cumulative alignment score falls off by the quantity X from its 20 maximum achieved value; the cumulative score goes to zero or below, due to the accumulation of one or more negative-scoring residue alignments; or the end of either sequence is reached. The BLAST algorithm parameters W, T, and X determine the sensitivity and speed of the alignment. The BLASTN program (for nucleotide sequences) uses as defaults a wordlength (W) of 11, an expectation (E) of 10, M=5, N=4 25 and a comparison of both strands. For amino acid sequences, the BLASTP program uses as defaults a wordlength of 3, and expectations (E) of 10, and the BLOSUM62 scoring matrix (see Henikoff and Henikoff, Proc. Natl. Acad. Sci., USA 89:10915, 1989) alignments (B) of 50, expectation (E) of 10, M=5, N=4, and a comparison of both strands.

30 The BLAST algorithm also performs a statistical analysis of the similarity between two sequences (see, for example, Karlin and Altschul, Proc. Natl. Acad. Sci., USA 90:5873, 1993, which is incorporated herein by reference). One measure of

similarity provided by BLAST algorithm is the smallest sum probability (P(N)), which provides an indication of the probability by which a match between two nucleotide or amino acid sequences would occur by chance. For example, a nucleic acid is considered similar to a references sequence if the smallest sum probability in a comparison of the test nucleic acid to the reference nucleic acid is less than about 0.2, more preferably less than about 0.01, and most preferably less than about 0.001. Significantly, upon identifying polynucleotides that are substantially similar to those of SEQ ID NOS:1-5379, the identified polynucleotides can be used as query sequences in a BLAST search to identify polynucleotides and polypeptides substantially similar thereto.

It should be noted that the nucleotide sequences set forth as SEQ ID NOS:1-2703 comprise coding sequences, whereas the nucleotide sequences set forth as SEQ ID NOS:2704-5379 comprise regulatory sequences. In addition, the coding sequences and regulatory sequences are related in that, for example, SEQ ID NO:1 is the coding sequence of a plant cold regulated gene having a 5' upstream (regulatory) sequence set forth as SEQ ID NO:2704 (see Table 2). Similarly, SEQ ID NO:2705 comprises a regulatory region of SEQ ID NO:2, SEQ ID NO:2706 comprises a regulatory region of SEQ ID NO:3, and so forth as shown in Table 2. As such, reference herein, for example, to a "polynucleotide comprising SEQ ID NO:1" can, unless indicated otherwise, include at least SEQ ID NO:2704. In some cases, the entire coding region of a plant stress regulated gene or the 5' upstream sequence has not yet been determined (see, for example, SEQ ID NO:43 in Table 3, where "none" indicates that 5' upstream regulatory sequences have not yet been determined). However, the determination of a complete coding sequence where only a portion is known or of regulatory sequences where a portion of the coding sequence is known can be made using methods as disclosed herein or otherwise known in the art.

In one embodiment, protein and nucleic acid sequence homologies are evaluated using the Basic Local Alignment Search Tool ("BLAST"). In particular, five specific BLAST programs are used to perform the following task:

- (1) BLASTP and BLAST3 compare an amino acid query sequence against a protein sequence database;
- (2) BLASTN compares a nucleotide query sequence against a nucleotide sequence database;

(3) BLASTX compares the six-frame conceptual translation products of a query nucleotide sequence (both strands) against a protein sequence database;

(4) TBLASTN compares a query protein sequence against a nucleotide sequence database translated in all six reading frames (both strands); and

5 (5) TBLASTX compares the six-frame translations of a nucleotide query sequence against the six-frame translations of a nucleotide sequence database.

The BLAST programs identify homologous sequences by identifying similar segments, which are referred to herein as "high-scoring segment pairs," between a query amino or nucleic acid sequence and a test sequence which is preferably
10 obtained from a protein or nucleic acid sequence database. High-scoring segment pairs are preferably identified (*i.e.*, aligned) by means of a scoring matrix, many of which are known in the art. Preferably, the scoring matrix used is the BLOSUM62 matrix (Gonnet et al., Science 256:1443-1445, 1992; Henikoff and Henikoff, Proteins 17:49-61, 1993, each of which is incorporated herein by reference). Less preferably,
15 the PAM or PAM250 matrices may also be used (Schwartz and Dayhoff, eds., "Matrices for Detecting Distance Relationships: Atlas of Protein Sequence and Structure" (Washington, National Biomedical Research Foundation 1978)). BLAST programs are accessible through the U.S. National Library of Medicine, for example, on the world wide web at address (url) "ncbi.nlm.nih.gov".

20 The parameters used with the above algorithms may be adapted depending on the sequence length and degree of homology studied. In some embodiments, the parameters may be the default parameters used by the algorithms in the absence of instructions from the user.

The term "substantially similar" also is used in reference to a comparison of
25 expression profiles of nucleotide sequences, wherein a determination that an expression profile characteristic of a stress response is substantially similar to the profile of nucleic acid molecules expressed in a plant cell being examined ("test plant") is indicative of exposure of the test plant cell to one or a combination of abiotic stress conditions. When used in reference to such a comparison of expression profiles, the
30 term "substantially similar" means that that the individual nucleotide sequences in the test plant cell profile are altered in the same manner as the corresponding nucleotide sequences in the expression profile characteristic of the stress response.

By way of example, where exposure to saline results in an increased expression of nucleotide sequences A, B and C, and a decreased expression of nucleotide sequences D and E, as indicated by the expression profile characteristic of a saline stress response, a determination that corresponding nucleotide sequences A, B and C in the test plant cell
5 are increased and that nucleotides sequences D and E are decreased is indicative of exposure of the test plant cell to a saline stress condition. It should be recognized that, where, for example, only nucleotide sequences A, B, D and E are examined in the test plant cell, an increase in A and B and a decrease in D and E expression of the test plant cells is considered to be substantially similar to the expression profile characteristic of a
10 saline stress condition and, therefore, is indicative of exposure of the plant cell to a saline stress condition. Similarly, where the levels of expression of the nucleotide sequences examined in a test plant are altered in the same manner, i.e., are increased or are decreased, as that observed in an expression profile characteristic of a particular stress response, the absolute levels of expression may vary, for example, two-fold, five-fold,
15 ten-fold, or the like. Nevertheless, the expression profile of the test plant cell is considered to be substantially similar to the expression profile characteristic of the particular stress response and, therefore, indicative of exposure of the plant cell to the stress condition.

As disclosed herein, clusters of stress-regulated genes (and their products), some
20 of which also have been described as having cellular functions such as enzymatic activity or roles as transcription factors, are involved in the response of plant cells to various abiotic stresses (see Tables 29-31; see, also, Tables 1 and 32). As such, the polynucleotide sequences comprising the genes in a cluster likely share common stress-regulated regulatory elements, including, for example, cold-regulated regulatory
25 elements (SEQ ID NOS:2704-3955), salinity-regulated regulatory elements (SEQ ID NOS:4910-5107, and osmotic pressure-regulated regulatory elements (SEQ ID NO:5108-5263), as well as regulatory elements that are responsive to a combination of stress conditions, but not to any of the individual stress conditions, alone (SEQ ID NOS:3956-4909 and 5263-5379). The identification of such clusters of genes thus
30 provides a means to identify the stress-regulated regulatory elements that control the level of expression of these genes.

As used herein, the term "plant stress-regulated gene" means a polynucleotide sequence of a plant, the transcription of which is altered in response to exposure to a stress condition, and the regulatory elements linked to such a polynucleotide sequence and involved in the stress response, which can be induction or repression. In general, plant stress gene regulatory elements are contained within a sequence including approximately two kilobases upstream (5') of the transcription or translation start site and two kilobases downstream (3') of the transcription or translation termination site. In the absence of an abiotic stress condition, the stress-regulated gene can normally be unexpressed in the cells, can be expressed at a basal level, which is induced to a higher level in response to the stress condition, or can be expressed at a level that is reduced (decreased) in response to the stress condition. The coding region of a plant stress-regulated gene encodes a stress-regulated polypeptide, and also can be the basis for expression of a functional RNA molecule such as an antisense molecule or ribozyme. A stress-regulated polypeptide can have an adaptive effect on a plant, thereby allowing the plant to better tolerate stress conditions; or can have a maladaptive effect, thereby decreasing the ability of the plant to tolerate the stress conditions.

The present invention provides an isolated plant stress-regulated regulatory element, which regulates expression of an operatively linked nucleotide sequence in a plant in response a stress condition. As disclosed herein, a plant stress-regulated regulatory element can be isolated from a polynucleotide sequence of a plant stress-regulated gene comprising a nucleotide sequence as set forth in SEQ ID NOS:1-2703, for example any of SEQ ID NOS:2704-5379 (see Table 2). It is recognized that certain of the polynucleotides set forth as SEQ ID NOS:1-5379 previously have been described as being involved in a stress-regulated response in plants, including SEQ ID NOS:156, 229, 233, 558, 573, 606, 625, 635, 787, 813, 1263, 1386, 1391, 1405, 1445, 1484, 1589, 1609, 1634, 1726, 1866, 1918, and 1928 and, therefore, are not encompassed, in whole or in part, within the compositions of the invention, and are encompassed within only certain particular methods of the invention, for example, methods of making a transgenic plant that is resistant to two or more stress conditions, since, even where such a gene was known to be expressed in response to a single stress condition such as cold or saline (e.g., SEQ ID NO:1263), it was not known

prior to the present disclosure that any of these genes was responsive to a combination of stress conditions (for example, a combination of cold and osmotic stress for SEQ ID NOS:1726, 1866, 1918, and 1928; or a combination of cold, osmotic and saline stress for SEQ ID NOS:1263,1386, 1391, 1405, 1445, 1484, 1589, 1609, and 1634).

5 Methods for identifying and isolating the stress-regulated regulatory element from the disclosed polynucleotides, or genomic DNA clones corresponding thereto, are well known in the art. For example, methods of making deletion constructs or linker-scanner constructs can be used to identify nucleotide sequences that are responsive to a stress condition. Generally, such constructs include a reporter gene
10 operatively linked to the sequence to be examined for regulatory activity. By performing such assays, a plant stress-regulated regulatory element can be defined within a sequence of about 500 nucleotides or fewer, generally at least about 200 nucleotides or fewer, particularly about 50 to 100 nucleotides, and more particularly at least about 20 nucleotides or fewer. Preferably the minimal (core)
15 sequence required for regulating a stress response of a plant is identified.

 The nucleotide sequences of the genes of a cluster also can be examined using a homology search engine such as described herein to identify sequences of conserved identity, particularly in the nucleotide sequence upstream of the transcription start site. Since all of the genes in a cluster as disclosed are induced in response to a
20 particular stress condition or a particular combination of stress conditions, some or all of the nucleotide sequences can share conserved stress-regulated regulatory elements. By performing such a homology search, putative stress-regulated regulatory elements can be identified. The ability of such identified sequences to function as a plant stress-regulated regulatory element can be confirmed, for example, by operatively
25 linking the sequence to a reporter gene and assaying the construct for responsiveness to a stress condition.

 As used herein, the term "regulatory element" means a nucleotide sequence that, when operatively linked to a coding region of a gene, effects transcription of the coding region such that a ribonucleic acid (RNA) molecule is transcribed from the
30 coding region. A regulatory element generally can increase or decrease the amount of transcription of a nucleotide sequence, for example, a coding sequence, operatively linked to the element with respect to the level at which the nucleotide sequence would

be transcribed absent the regulatory element. Regulatory elements are well known in the art and include promoters, enhancers, silencers, inactivated silencer intron sequences, 3'-untranslated or 5'-untranslated sequences of transcribed sequence, for example, a poly-A signal sequence, or other protein or RNA stabilizing elements, or other gene expression control elements known to regulate gene expression or the amount of expression of a gene product. A regulatory element can be isolated from a naturally occurring genomic DNA sequence or can be synthetic, for example, a synthetic promoter.

Regulatory elements can be constitutively expressed regulatory element, which maintain gene expression at a relative level of activity (basal level), or can be regulated regulatory elements. Constitutively expressed regulatory elements can be expressed in any cell type, or can be tissue specific, which are expressed only in particular cell types, phase specific, which are expressed only during particular developmental or growth stages of a plant cell, or the like. A regulatory element such as a tissue specific or phase specific regulatory element or an inducible regulatory element useful in constructing a recombinant polynucleotide or in a practicing a method of the invention can be a regulatory element that generally, in nature, is found in a plant genome. However, the regulatory element also can be from an organism other than a plant, including, for example, from a plant virus, an animal virus, or a cell from an animal or other multicellular organism.

A regulatory element useful for practicing method of the present is a promoter element. Useful promoters include, but are not limited to, constitutive, inducible, temporally regulated, developmentally regulated, spatially-regulated, chemically regulated, stress-responsive, tissue-specific, viral and synthetic promoters. Promoter sequences are known to be strong or weak. A strong promoter provides for a high level of gene expression, whereas a weak promoter provides for a very low level of gene expression. An inducible promoter is a promoter that provides for the turning on and off of gene expression in response to an exogenously added agent, or to an environmental or developmental stimulus. A bacterial promoter such as the P_{tac} promoter can be induced to varying levels of gene expression depending on the level of isothiopyl galactoside added to the transformed bacterial cells. An isolated promoter sequence that is a strong promoter for heterologous nucleic acid is

advantageous because it provides for a sufficient level of gene expression to allow for easy detection and selection of transformed cells and provides for a high level of gene expression when desired.

Within a plant promoter region there are several domains that are necessary
5 for full function of the promoter. The first of these domains lies immediately upstream of the structural gene and forms the "core promoter region" containing consensus sequences, normally 70 base pairs immediately upstream of the gene. The core promoter region contains the characteristic CAAT and TATA boxes plus surrounding sequences, and represents a transcription initiation sequence that defines
10 the transcription start point for the structural gene.

The presence of the core promoter region defines a sequence as being a promoter: if the region is absent, the promoter is non-functional. The core promoter region, however, is insufficient to provide full promoter activity. A series of regulatory sequences upstream of the core constitute the remainder of the promoter.
15 These regulatory sequences determine expression level, the spatial and temporal pattern of expression and, for an important subset of promoters, expression under inductive conditions (regulation by external factors such as light, temperature, chemicals, hormones).

To define a minimal promoter region, a DNA segment representing the
20 promoter region is removed from the 5' region of the gene of interest and operably linked to the coding sequence of a marker (reporter) gene by recombinant DNA techniques well known to the art. The reporter gene is operably linked downstream of the promoter, so that transcripts initiating at the promoter proceed through the reporter gene. Reporter genes generally encode proteins which are easily measured, including,
25 but not limited to, chloramphenicol acetyl transferase (CAT), beta-glucuronidase (GUS), green fluorescent protein (GFP), 9-galactosidase (9-GAL), and luciferase.

The construct containing the reporter gene under the control of the promoter is then introduced into an appropriate cell type by transfection techniques well known to the art. To assay for the reporter protein, cell lysates are prepared and appropriate
30 assays, which are well known in the art, for the reporter protein are performed. For example, if CAT were the reporter gene of choice, the lysates from cells transfected with constructs containing CAT under the control of a promoter under study are

mixed with isotopically labeled chloramphenicol and acetyl-coenzyme A (acetyl-CoA). The CAT enzyme transfers the acetyl group from acetyl-CoA to the 2-position or 3-position of chloramphenicol. The reaction is monitored by thin layer chromatography, which separates acetylated chloramphenicol from unreacted material. The reaction products are then visualized by autoradiography.

The level of enzyme activity corresponds to the amount of enzyme that was made, which in turn reveals the level of expression from the promoter of interest. This level of expression can be compared to other promoters to determine the relative strength of the promoter under study. In order to be sure that the level of expression is determined by the promoter, rather than by the stability of the mRNA, the level of the reporter mRNA can be measured directly, for example, by northern blot analysis. Once activity is detected, mutational and/or deletional analyses may be employed to determine the minimal region and/or sequences required to initiate transcription. Thus, sequences can be deleted at the 5' end of the promoter region and/or at the 3' end of the promoter region, and nucleotide substitutions introduced. These constructs are then introduced to cells and their activity determined.

The choice of promoter will vary depending on the temporal and spatial requirements for expression, and also depending on the target species. In some cases, expression in multiple tissues is desirable. While in others, tissue-specific, e.g., leaf-specific, seed-specific, petal-specific, anther-specific, or pith-specific, expression is desirable. Although many promoters from dicotyledons have been shown to be operational in monocotyledons and *vice versa*, ideally dicotyledonous promoters are selected for expression in dicotyledons, and monocotyledonous promoters for expression in monocotyledons. There is, however, no restriction to the origin or source of a selected promoter. It is sufficient that the promoters are operational in driving the expression of a desired nucleotide sequence in the particular cell.

A range of naturally-occurring promoters are known to be operative in plants and have been used to drive the expression of heterologous (both foreign and endogenous) genes and nucleotide sequences in plants: for example, the constitutive 35S cauliflower mosaic virus (CaMV) promoter, the ripening-enhanced tomato polygalacturonase promoter (Bird et al., 1988), the E8 promoter (Diekman and Fischer, 1988) and the fruit specific 2A1 promoter (Pear et al., 1989). Many other

promoters, e.g., U2 and U5 snRNA promoters from maize, the promoter from alcohol dehydrogenase, the Z4 promoter from a gene encoding the Z4 22 kD zein protein, the Z10 promoter from a gene encoding a 10 kD zein protein, a Z27 promoter from a gene encoding a 27 kD zein protein, the A20 promoter from the gene encoding a 19 kD zein protein, inducible promoters, such as the light inducible promoter derived from the pea *rbcS* gene and the actin promoter from rice, e.g., the actin 2 promoter (WO 00/70067); seed specific promoters, such as the phaseolin promoter from beans, may also be used. The nucleotide sequences of the stress-regulated genes of this invention can also be expressed under the regulation of promoters that are chemically regulated. This enables the nucleic acid sequence or encoded polypeptide to be synthesized only when the crop plants are treated with the inducing chemicals. Chemical induction of gene expression is detailed in EP 0 332 104 and U.S. Pat. 5,614,395.

In some instances it may be desirable to link a constitutive promoter to a polynucleotide comprising a stress regulated gene of the invention. Examples of some constitutive promoters include the rice actin 1 (Wang et al., 1992; U.S. Pat. No. 5,641,876), CaMV 35S (Odell et al., 1985), CaMV 19S (Lawton et al., 1987), *nos*, *Adh*, sucrose synthase; and the ubiquitin promoters.

In other situations it may be desirable to limit expression of stress-related sequences to specific tissues or stages of development. As used herein, the term "tissue specific or phase specific regulatory element" means a nucleotide sequence that effects transcription in only one or a few cell types, or only during one or a few stages of the life cycle of a plant, for example, only for a period of time during a particular stage of growth, development or differentiation. The terms "tissue specific" and "phase specific" are used together herein in referring to a regulatory element because a single regulatory element can have characteristics of both types of regulatory elements. For example, a regulatory element active only during a particular stage of plant development also can be expressed only in one or a few types of cells in the plant during the particular stage of development. As such, any attempt to classify such regulatory elements as tissue specific or as phase specific can be difficult. Accordingly, unless indicated otherwise, all regulatory elements having the

characteristic of a tissue specific regulatory element, or a phase specific regulatory element, or both are considered together for purposes of the present invention.

Examples of tissue specific promoters which have been described include the lectin (Vodkin, 1983; Lindstrom et al., 1990) corn alcohol dehydrogenase 1 (Vogel et al., 1989; Dennis et al., 1984), corn light harvesting complex (Simpson, 1986; Bansal et al., 1992), corn heat shock protein (Odell et al., 1985), pea small subunit RuBP carboxylase (Poulsen et al., 1986), Ti plasmid mannopine synthase and Ti plasmid nopaline synthase (Langridge et al., 1989), petunia chalcone isomerase (vanTunen et al., 1988), bean glycine rich protein 1 (Keller et al., 1989), truncated CaMV 35s (Odell et al., 1985), potato patatin (Wenzler et al., 1989), root cell (Yamamoto et al., 1990), maize zein (Reina et al., 1990; Kriz et al., 1987; Wandelt et al., 1989; Langridge et al., 1983; Reina et al., 1990), globulin-1 (Belanger et al., 1991), α -tubulin, cab (Sullivan et al., 1989), PEPCase (Hudspeth & Grula, 1989), R gene complex-associated promoters (Chandler et al., 1989), histone, and chalcone synthase promoters (Franken et al., 1991). Tissue specific enhancers are described by Fromm et al. (1989).

Several other tissue-specific regulated genes and/or promoters have been reported in plants, including genes encoding seed storage proteins such as napin, cruciferin, beta-conglycinin, and phaseolin, zein or oil body proteins such as oleosin, genes involved in fatty acid biosynthesis, including acyl carrier protein, stearyl-ACP desaturase, fatty acid desaturases (fad 2-1), and other genes expressed during embryonic development such as Bce4 (see, for example, EP 255378 and Kridl et al., 1991). Particularly useful for seed-specific expression is the pea vicilin promoter (Czako et al., 1992). (See also U.S. Pat. No. 5,625,136, which is incorporated herein by reference.) Other useful promoters for expression in mature leaves are those that are switched on at the onset of senescence, such as the SAG promoter from *Arabidopsis* (Gan et al., 1995).

A class of fruit-specific promoters expressed at or during antithesis through fruit development, at least until the beginning of ripening, is discussed in U.S. Pat. No. 4,943,674. cDNA clones that are preferentially expressed in cotton fiber have been isolated (John et al., 1992). cDNA clones from tomato displaying differential expression during fruit development have been isolated and characterized (Mansson et

al., 1985, Slater et al., 1985). The promoter for polygalacturonase gene is active in fruit ripening. The polygalacturonase gene is described in U.S. Pat. Nos. 4,535,060, 4,769,061, 4,801,590, and 5,107,065, each of which is incorporated herein by reference.

5 Other examples of tissue-specific promoters include those that direct expression in leaf cells following damage to the leaf (for example, from chewing insects), in tubers (for example, patatin gene promoter), and in fiber cells (an example of a developmentally-regulated fiber cell protein is E6 (John et al., 1992). The E6 gene is most active in fiber, although low levels of transcripts are found in leaf,
10 ovule and flower.

Additional tissue specific or phase specific regulatory elements include, for example, the *AGL8/FRUITFULL* regulatory element, which is activated upon floral induction (Hempel et al., Development 124:3845-3853, 1997, which is incorporated herein by reference); root specific regulatory elements such as the regulatory elements
15 from the RCP1 gene and the LRP1 gene (Tsugeki and Fedoroff, Proc. Natl. Acad. USA 96:12941-12946, 1999; Smith and Fedoroff, Plant Cell 7:735-745, 1995, each of which is incorporated herein by reference); flower specific regulatory elements such as the regulatory elements from the *LEAFY* gene and the *APETELA1* gene (Blazquez et al., Development 124:3835-3844, 1997, which is incorporated herein by reference;
20 Hempel et al., *supra*, 1997); seed specific regulatory elements such as the regulatory element from the oleosin gene (Plant et al., Plant Mol. Biol. 25:193-205, 1994, which is incorporated herein by reference), and dehiscence zone specific regulatory element. Additional tissue specific or phase specific regulatory elements include the Zn13 promoter, which is a pollen specific promoter (Hamilton et al., Plant Mol. Biol.
25 18:211-218, 1992, which is incorporated herein by reference); the *UNUSUAL FLORAL ORGANS (UFO)* promoter, which is active in apical shoot meristem; the promoter active in shoot meristems (Atanassova et al., Plant J. 2:291, 1992, which is incorporated herein by reference), the *cdc2a* promoter and *cyc07* promoter (see, for example, Ito et al., Plant Mol. Biol. 24:863, 1994; Martinez et al., Proc. Natl. Acad. Sci., USA 89:7360, 1992; Medford et al., Plant Cell 3:359, 1991; Terada et al., Plant J.
30 3:241, 1993; Wissenbach et al., Plant J. 4:411, 1993, each of which is incorporated herein by reference); the promoter of the *APETELA3* gene, which is active in floral

meristems (Jack et al., *Cell* 76:703, 1994, which is incorporated herein by reference; Hempel et al., *supra*, 1997); a promoter of an agamous-like (AGL) family member, for example, AGL8, which is active in shoot meristem upon the transition to flowering (Hempel et al., *supra*, 1997); floral abscission zone promoters; L1-specific promoters; and the like.

The tissue-specificity of some "tissue-specific" promoters may not be absolute and may be tested by one skilled in the art using the diphtheria toxin sequence. One can also achieve tissue-specific expression with "leaky" expression by a combination of different tissue-specific promoters (Beals et al., 1997). Other tissue-specific promoters can be isolated by one skilled in the art (see U.S. 5,589,379). Several inducible promoters ("gene switches") have been reported, many of which are described in the review by Gatz (1996) and Gatz (1997). These include tetracycline repressor system, *Lac* repressor system, copper inducible systems, salicylate inducible systems (such as the PR1a system), glucocorticoid (Aoyama et al., 1997) and ecdysone inducible systems. Also included are the benzene sulphonamide (U.S. Pat. No. 5,364,780) and alcohol (WO 97/06269 and WO 97/06268) inducible systems and glutathione S-transferase promoters.

In some instances it might be desirable to inhibit expression of a native DNA sequence within a plant's tissues to achieve a desired phenotype. In this case, such inhibition might be accomplished with transformation of the plant to comprise a constitutive, tissue-independent promoter operably linked to an antisense nucleotide sequence, such that constitutive expression of the antisense sequence produces an RNA transcript that interferes with translation of the mRNA of the native DNA sequence.

Inducible regulatory elements also are useful for purposes of the present invention. As used herein, the term "inducible regulatory element" means a regulatory element that, when exposed to an inducing agent, effects an increased level of transcription of a nucleotide sequence to which it is operatively linked as compared to the level of transcription, if any, in the absence of an inducing agent. Inducible regulatory elements can be those that have no basal or constitutive activity and only effect transcription upon exposure to an inducing agent, or those that effect a basal or constitutive level of transcription, which is increased upon exposure to an inducing

agent. Inducible regulatory elements that effect a basal or constitutive level of expression generally are useful in a method or composition of the invention where the induced level of transcription is substantially greater than the basal or constitutive level of expression, for example, at least about two-fold greater, or at least about five-fold greater. Particularly useful inducible regulatory elements do not have a basal or constitutive activity, or increase the level of transcription at least about ten-fold greater than a basal or constitutive level of transcription associated with the regulatory element.

Inducible promoters that have been described include the ABA- and turgor-inducible promoters, the promoter of the auxin-binding protein gene (Schwob et al., 1993), the UDP glucose flavonoid glycosyl-transferase gene promoter (Ralston et al., 1988), the MPI proteinase inhibitor promoter (Cordero et al., 1994), and the glyceraldehyde-3-phosphate dehydrogenase gene promoter (Kohler et al., 1995; Quigley et al., 1989; Martinez et al., 1989).

The term "inducing agent" is used to refer to a chemical, biological or physical agent or environmental condition that effects transcription from an inducible regulatory element. In response to exposure to an inducing agent, transcription from the inducible regulatory element generally is initiated *de novo* or is increased above a basal or constitutive level of expression. Such induction can be identified using the methods disclosed herein, including detecting an increased level of RNA transcribed from a nucleotide sequence operatively linked to the regulatory element, increased expression of a polypeptide encoded by the nucleotide sequence, or a phenotype conferred by expression of the encoded polypeptide.

An inducing agent useful in a method of the invention is selected based on the particular inducible regulatory element. For example, the inducible regulatory element can be a metallothionein regulatory element, a copper inducible regulatory element or a tetracycline inducible regulatory element, the transcription from which can be effected in response to metal ions, copper or tetracycline, respectively (Furst et al., Cell 55:705-717, 1988; Mett et al., Proc. Natl. Acad. Sci., USA 90:4567-4571, 1993; Gatz et al., Plant J. 2:397-404, 1992; Roder et al., Mol. Gen. Genet. 243:32-38, 1994, each of which is incorporated herein by reference). The inducible regulatory element also can be an ecdysone regulatory element or a glucocorticoid regulatory

element, the transcription from which can be effected in response to ecdysone or other steroid (Christopherson et al., Proc. Natl. Acad. Sci., USA 89:6314-6318, 1992; Schena et al., Proc. Natl. Acad. Sci., USA 88:10421-10425, 1991, each of which is incorporated herein by reference). In addition, the regulatory element can be a cold responsive regulatory element or a heat shock regulatory element, the transcription of which can be effected in response to exposure to cold or heat, respectively (Takahashi et al., Plant Physiol. 99:383-390, 1992, which is incorporated herein by reference). Additional regulatory elements useful in the methods or compositions of the invention include, for example, the spinach nitrite reductase gene regulatory element (Back et al., Plant Mol. Biol. 17:9, 1991, which is incorporated herein by reference); a light inducible regulatory element (Feinbaum et al., Mol. Gen. Genet. 226:449, 1991; Lam and Chua, Science 248:471, 1990, each of which is incorporated herein by reference), a plant hormone inducible regulatory element (Yamaguchi-Shinozaki et al., Plant Mol. Biol. 15:905, 1990; Kares et al., Plant Mol. Biol. 15:225, 1990, each of which is incorporated herein by reference), and the like.

An inducible regulatory element also can be a plant stress-regulated regulatory element of the invention. In addition to the known stress conditions that specifically induce or repress expression from such elements, the present invention provides methods of identifying agents that mimic a stress condition. Accordingly, such stress mimics are considered inducing or repressing agents with respect to a plant stress-regulated regulatory element. In addition, a recombinant polypeptide comprising a zinc finger domain, which is specific for the regulatory element, and an effector domain, particularly an activator, can be useful as an inducing agent for a plant stress-regulated regulatory element. Furthermore, such a recombinant polypeptide provides the advantage that the effector domain can be a repressor domain, thereby providing a repressing agent, which decreases expression from the regulatory element. In addition, use of such a method of modulating expression of an endogenous plant stress-regulated gene provides the advantage that the polynucleotide encoding the recombinant polypeptide can be introduced into cells of the plant, thus providing a transgenic plant that can be regulated coordinately with the endogenous plant stress-regulated gene upon exposure to a stress condition. A polynucleotide encoding such a

recombinant polypeptide can be operatively linked to and expressed from a constitutively active, inducible or tissue specific or phase specific regulatory element.

In one embodiment, the promoter may be a gamma zein promoter, an oleosin ole16 promoter, a globulin I promoter, an actin I promoter, an actin cl promoter, a
 5 sucrose synthetase promoter, an INOPS promoter, an EXM5 promoter, a globulin2 promoter, a b-32, ADPG-pyrophosphorylase promoter, an LtpI promoter, an Ltp2 promoter, an oleosin ole17 promoter, an oleosin ole18 promoter, an actin 2 promoter, a pollen-specific protein promoter, a pollen-specific pectate lyase promoter, an anther-specific protein promoter (Huffman), an anther-specific gene RTS2 promoter, a
 10 pollen- specific gene promoter, a tapetum-specific gene promoter, tapetum- specific gene RAB24 promoter, a anthranilate synthase alpha subunit promoter, an alpha zein promoter, an anthranilate synthase beta subunit promoter, a dihydrodipicolinate synthase promoter, a Thi 1 promoter, an alcohol dehydrogenase promoter, a cab binding protein promoter, an H3C4 promoter, a RUBISCO SS starch branching
 15 enzyme promoter, an ACCase promoter, an actin3 promoter, an actin7 promoter, a regulatory protein GF14-12 promoter, a ribosomal protein L9 promoter, a cellulose biosynthetic enzyme promoter, an S-adenosyl-L-homocysteine hydrolase promoter, a superoxide dismutase promoter, a C-kinase receptor promoter, a phosphoglycerate mutase promoter, a root-specific RCc3 mRNA promoter, a glucose-6 phosphate
 20 isomerase promoter, a pyrophosphate-fructose 6-phosphatetphosphotransferase promoter, an ubiquitin promoter, a beta-ketoacyl-ACP synthase promoter, a 33 kDa photosystem 11 promoter, an oxygen evolving protein promoter, a 69 kDa vacuolar ATPase subunit promoter, a metallothionein-like protein promoter, a glyceraldehyde-3-phosphate dehydrogenase promoter, an ABA- and ripening- inducible-like protein
 25 promoter, a phenylalanine ammonia lyase promoter, an adenosine triphosphatase S-adenosyl-L-homocysteine hydrolase promoter, an a- tubulin promoter, a cab promoter, a PEPCase promoter, an R gene promoter, a lectin promoter, a light harvesting complex promoter, a heat shock protein promoter, a chalcone synthase promoter, a zein promoter, a globulin-1 promoter, an ABA promoter, an auxin-
 30 binding protein promoter, a UDP glucose flavonoid glycosyl-transferase gene promoter, an NTI promoter, an actin promoter, an opaque 2 promoter, a b70 promoter, an oleosin promoter, a CaMV 35S promoter, a CaMV 19S promoter, a histone

promoter, a turgor-inducible promoter, a pea small subunit RuBP carboxylase promoter, a Ti plasmid mannopine synthase promoter, Ti plasmid nopaline synthase promoter, a petunia chalcone isomerase promoter, a bean glycine rich protein I promoter, a CaMV 35S transcript promoter, a potato patatin promoter, or a S-E9 small
5 subunit RuBP carboxylase promoter.

In addition to promoters, a variety of 5N and 3N transcriptional regulatory sequences are also available for use in the present invention. Transcriptional terminators are responsible for the termination of transcription and correct mRNA polyadenylation. The 3'-untranslated regulatory DNA sequence preferably includes
10 from about 50 to about 1,000, more preferably about 100 to about 1,000, nucleotide base pairs and contains plant transcriptional and translational termination sequences. Appropriate transcriptional terminators and those which are known to function in plants include the CaMV 35S terminator, the *tml* terminator, the nopaline synthase terminator, the pea rbcS E9 terminator, the terminator for the T7 transcript from the
15 octopine synthase gene of *Agrobacterium tumefaciens*, and the 3N end of the protease inhibitor I or II genes from potato or tomato, although other 3N elements known to those of skill in the art can also be employed. Alternatively, one also could use a gamma coixin, oleosin 3 or other terminator from the genus *Coix*. Preferred 3' elements include those from the nopaline synthase gene of *Agrobacterium*
20 *tumefaciens* (Bevan et al., 1983), the terminator for the T7 transcript from the octopine synthase gene of *Agrobacterium tumefaciens*, and the 3' end of the protease inhibitor I or II genes from potato or tomato.

As the DNA sequence between the transcription initiation site and the start of the coding sequence, i.e., the untranslated leader sequence, can influence gene
25 expression, one may also wish to employ a particular leader sequence. Preferred leader sequences are contemplated to include those that include sequences predicted to direct optimum expression of the attached sequence, i.e., to include a preferred consensus leader sequence that may increase or maintain mRNA stability and prevent inappropriate initiation of translation. The choice of such sequences will be known to
30 those of skill in the art in light of the present disclosure. Sequences that are derived from genes that are highly expressed in plants will be most preferred.

Other sequences that have been found to enhance gene expression in transgenic plants include intron sequences (e.g., from *Adh1*, *bronze1*, *actin1*, *actin 2* (WO 00/760067), or the sucrose synthase intron) and viral leader sequences (e.g., from TMV, MCMV and AMV). For example, a number of non-translated leader
5 sequences derived from viruses are known to enhance expression. Specifically, leader sequences from tobacco mosaic virus (TMV), maize chlorotic mottle virus (MCMV), and alfalfa mosaic virus (AMV) have been shown to be effective in enhancing expression (e.g., Gallie et al., 1987; Skuzeski et al., 1990). Other leaders known in the art include but are not limited to picornavirus leaders, for example, EMCV leader
10 (encephalomyocarditis virus 5' non-coding region; Elroy-Stein et al., 1989); potyvirus leaders, for example, TEV leader (tobacco etch virus); MDMV leader (maize dwarf mosaic virus); human immunoglobulin heavy chain binding protein (BiP) leader, (Macejak et al., 1991); untranslated leader from the coat protein mRNA of AMV (AMV RNA 4; Jobling et al., 1987), TMV (Gallie et al., 1989), and MCMV (Lommel
15 et al., 1991; see also, della Cioppa et al., 1987).

Regulatory elements such as *Adh* intron 1 (Callis et al., 1987), sucrose synthase intron (Vasil et al., 1989) or TMV omega element (Gallie, et al., 1989), may further be included where desired. Examples of enhancers include elements from the CaMV 35S promoter, octopine synthase genes (Ellis et al., 1987), the rice actin I
20 gene, the maize alcohol dehydrogenase gene (Callis et al., 1987), the maize shrunken I gene (Vasil et al., 1989), TMV Omega element (Gallie et al., 1989) and promoters from non-plant eukaryotes (e.g. yeast; Ma et al., 1988).

Vectors for use in accordance with the present invention may be constructed to include the ocs enhancer element, which was first identified as a 16 bp palindromic
25 enhancer from the octopine synthase (ocs) gene of *utilane* (Ellis et al., 1987), and is present in at least 10 other promoters (Bouchez et al., 1989). The use of an enhancer element, such as the ocs element and particularly multiple copies of the element, will act to increase the level of transcription from adjacent promoters when applied in the context of monocot transformation.

30 The methods of the invention provide genetically modified plant cells, which can contain, for example, a coding region, or peptide portion thereof, of a plant stress-regulated gene operatively linked to a heterologous inducible regulatory element; or a

plant stress-regulated regulatory element operatively linked to a heterologous nucleotide sequence encoding a polypeptide of interest. In such a plant, the expression from the inducible regulatory element can be effected by exposing the plant cells to an inducing agent in any of numerous ways depending, for example, on the inducible regulatory element and the inducing agent. For example, where the inducible regulatory element is a cold responsive regulatory element present in the cells of a transgenic plant, the plant can be exposed to cold conditions, which can be produced artificially, for example, by placing the plant in a thermostatically controlled room, or naturally, for example, by planting the plant in an environment characterized, at least in part, by attaining temperatures sufficient to induce transcription from the promoter but not so cold as to kill the plants. By examining the phenotype of such transgenic plants, those plants that ectopically express a gene product that confers increased resistance of the plant to cold can be identified. Similarly, a transgenic plant containing a metallothionein promoter can be exposed to metal ions such as cadmium or copper by watering the plants with a solution containing the inducing metal ions, or can be planted in soil that is contaminated with a level of such metal ions that is toxic to most plants. The phenotype of surviving plants can be observed, those expressing desirable traits can be selected.

As used herein, the term "phenotype" refers to a physically detectable characteristic. A phenotype can be identified visually by inspecting the physical appearance of a plant following exposure, for example, to increased osmotic conditions; can be identified using an assay to detecting a product produced due to expression of reporter gene, for example, an RNA molecule, a polypeptide such as an enzyme, or other detectable signal such as disclosed herein; or by using any appropriate tool useful for identifying a phenotype of a plant, for example, a microscope, a fluorescence activated cell sorter, or the like.

A transgenic plant containing an inducible regulatory element such as a steroid inducible regulatory element can be exposed to a steroid by watering the plants with a solution containing the steroid. The use of an inducible regulatory element that is induced upon exposure to a chemical or biological inducing agent that can be placed in solution or suspension in an aqueous medium can be particularly useful because the inducing agent can be applied conveniently to a relatively large crop of transgenic

plants containing the inducible regulatory element, for example, through a watering system or by spraying the inducing agent over the field. As such, inducible regulatory elements that are responsive to an environmental inducing agent, for example, cold; heat; metal ions or other potentially toxic agents such as pesticides, which can
5 contaminate a soil; or the like; or inducible regulatory elements that are regulated by inducing agents that conveniently can be applied to plants, can be particularly useful in a method or composition of the invention, and allow the identification and selection of plants that express desirable traits and survive and grow in environments that otherwise would not support growth of the plants.

10 As disclosed herein, the present invention provides plant stress-regulated regulatory elements, which are identified based on the expression of clusters of plant genes in response to stress. As used herein, the term "stress-regulated regulatory element of a plant" or "plant stress-regulated regulatory element" means a nucleotide sequence of a plant genome that can respond to a stress such that expression of a gene
15 product encoded by a gene comprising the regulatory element (a stress-inducible gene) is increased above or decreased below the level of expression of the gene product in the absence of the stress condition. The regulatory element can be any gene regulatory element, including, for example, a promoter, an enhancer, a silencer, or the like. In one embodiment, the plant stress-regulated regulatory element is a
20 plant stress-regulated promoter.

For purposes of modulating the responsiveness of a plant to a stress condition, it can be useful to introduce a modified plant stress-regulated regulatory element into a plant. Such a modified regulatory element can have any desirable characteristic, for example, it can be inducible to a greater level than the corresponding wild-type
25 promoter, or it can be inactivated such that, upon exposure to a stress, there is little or no induction of expression of a nucleotide sequence operatively linked to the mutant element. A plant stress-regulated regulatory element can be modified by incorporating random mutations using, for example, *in vitro* recombination or DNA shuffling (Stemmer et al., Nature 370: 389-391, 1994; U.S. Pat. No. 5,605,793, each
30 of which is incorporated herein by reference). Using such a method, millions of mutant copies of the polynucleotide, for example, stress-regulated regulatory element,

can be produced based on the original nucleotide sequence, and variants with improved properties, such as increased inducibility can be recovered.

A mutation method such as DNA shuffling encompasses forming a mutagenized double-stranded polynucleotide from a template double-stranded polynucleotide, wherein the template double-stranded polynucleotide has been
5 cleaved into double stranded random fragments of a desired size, and comprises the steps of adding to the resultant population of double-stranded random fragments one or more single or double stranded oligonucleotides, wherein the oligonucleotides comprise an area of identity and an area of heterology to the double stranded template
10 polynucleotide; denaturing the resultant mixture of double stranded random fragments and oligonucleotides into single stranded fragments; incubating the resultant population of single stranded fragments with a polymerase under conditions that result in the annealing of the single stranded fragments at the areas of identity to form pairs of annealed fragments, the areas of identity being sufficient for one member of a
15 pair to prime replication of the other, thereby forming a mutagenized double-stranded polynucleotide; and repeating the second and third steps for at least two further cycles, wherein the resultant mixture in the second step of a further cycle includes the mutagenized double-stranded polynucleotide from the third step of the previous cycle, and the further cycle forms a further mutagenized double-stranded polynucleotide.
20 Preferably, the concentration of a single species of double stranded random fragment in the population of double stranded random fragments is less than 1% by weight of the total DNA. In addition, the template double stranded polynucleotide can comprise at least about 100 species of polynucleotides. The size of the double stranded random fragments can be from about 5 base pairs to 5 kilobase pairs. In a further
25 embodiment, the fourth step of the method comprises repeating the second and the third steps for at least 10 cycles.

A plant stress-regulated regulatory element of the invention is useful for expressing a nucleotide sequence operatively linked to the element in a cell, particularly a plant cell. As used herein, the term "expression" refers to the
30 transcription and/or translation of an endogenous gene or a transgene in plants. In the case of an antisense molecule, for example, the term "expression" refers to the transcription of the polynucleotide encoding the antisense molecule.

As used herein, the term "operatively linked," when used in reference to a plant stress-regulated regulatory element, means that the regulatory element is positioned with respect to a second nucleotide sequence such that the regulatory element effects transcription or transcription and translation of the nucleotide sequence in substantially the same manner, but not necessarily to the same extent, as it does when the regulatory element is present in its natural position in a genome. Transcriptional promoters, for example, generally act in a position and orientation dependent manner and usually are positioned at or within about five nucleotides to about fifty nucleotides 5' (upstream) of the start site of transcription of a gene in nature. In comparison, enhancers and silencers can act in a relatively position or orientation independent manner and, therefore, can be positioned several hundred or thousand nucleotides upstream or downstream from a transcription start site, or in an intron within the coding region of a gene, yet still be operatively linked to a coding region so as to effect transcription.

The second nucleotide sequence, i.e., the sequence operatively linked to the plant stress-regulated regulatory element, can be any nucleotide sequence, including, for example, a coding region of a gene or cDNA; a sequence encoding an antisense molecule, an RNAi molecule, ribozyme, triplexing agent (see, for example, Frank-Kamenetskii and Mirkin, Ann. Rev. Biochem. 64:65-95, 1995), or the like; or a sequence that, when transcribed, can be detected in the cell using, for example, by hybridization or amplification, or when translated produces a detectable signal. The term "coding region" is used broadly herein to include a nucleotide sequence of a genomic DNA or a cDNA molecule comprising all or part of a coding region of the coding strand. A coding region can be transcribed from an operatively linked regulatory element, and can be translated into a full length polypeptide or a peptide portion of a polypeptide. It should be recognized that, in a nucleotide sequence comprising a coding region, not all of the nucleotides in the sequence need necessarily encode the polypeptide and, particularly, that a gene transcript can contain one or more introns, which do not encode an amino acid sequence of a polypeptide but, nevertheless, are part of the coding region, particularly the coding strand, of the gene.

The present invention also relates to a recombinant polynucleotide, which contains a polynucleotide portion of a plant stress-regulated gene operatively linked to

a heterologous nucleotide sequence. As used herein, the term "polynucleotide portion of plant stress-regulated sequence" means a contiguous nucleotide sequence of the plant stress-regulated gene that provides a function. The portion can be any portion of the sequence, particularly a coding sequence, or a sequence encoding a peptide portion of the stress-regulated polypeptide; the stress-regulated regulatory element; a sequence useful as an antisense molecule or triplexing agent; or a sequence useful for disrupting (knocking-out) an endogenous plant stress-regulated gene.

A heterologous nucleotide sequence is a nucleotide sequence that is not normally part of the plant stress-regulated gene from which the polynucleotide portion of the plant stress-regulated gene-component of the recombinant polynucleotide is obtained; or, if it is a part of the plant stress-regulated gene from which the polynucleotide portion is obtained, it is an orientation other than it would normally be in, for example, is an antisense sequence, or comprises at least partially discontinuous as compared to the genomic structure, for example, a single exon operatively linked to the regulatory element. In general, where the polynucleotide portion of the plant stress-regulated gene comprises the coding sequence in a recombinant polynucleotide of the invention, the heterologous nucleotide sequence will function as a regulatory element. The regulatory element can be any heterologous regulatory element, including, for example, a constitutively active regulatory element, an inducible regulatory element, or a tissue specific or phase specific regulatory element, as disclosed above. Conversely, where the polynucleotide portion of the plant stress-regulated polynucleotide comprises the stress-regulated regulatory element of a recombinant polynucleotide of the invention, the heterologous nucleotide sequence generally will be a nucleotide sequence that can be transcribed and, if desired, translated. Where the heterologous nucleotide sequence is expressed from a plant stress-regulated regulatory element, it generally confers a desirable phenotype to a plant cell containing the recombinant polynucleotide, or provides a means to identify a plant cell containing the recombinant polynucleotide. It should be recognized that a "desirable" phenotype can be one that decreases the ability of a plant cell to compete where the plant cell, or a plant containing the cell, is an undesired plant cell. Thus, a heterologous nucleotide sequence can allow a plant to grow, for example, under conditions in which it would not normally be able to grow.

A heterologous nucleotide sequence can be, or encode, a selectable marker. As used herein, the term "selectable marker" is used herein to refer to a molecule that, when present or expressed in a plant cell, provides a means to identify a plant cell containing the marker. As such, a selectable marker can provide a means for
5 screening a population of plants, or plant cells, to identify those having the marker. A selectable marker also can confer a selective advantage to the plant cell, or a plant containing the cell. The selective advantage can be, for example, the ability to grow in the presence of a negative selective agent such as an antibiotic or herbicide, compared to the growth of plant cells that do not contain the selectable marker. The
10 selective advantage also can be due, for example, to an enhanced or novel capacity to utilize an added compound as a nutrient, growth factor or energy source. A selectable advantage can be conferred, for example, by a single polynucleotide, or its expression product, or to a combination of polynucleotides whose expression in a plant cell gives the cell with a positive selective advantage, a negative selective advantage, or both.

15 Examples of selectable markers include those that confer antimetabolite resistance, for example, dihydrofolate reductase, which confers resistance to methotrexate (Reiss, Plant Physiol. (Life Sci. Adv.) 13:143-149, 1994); neomycin phosphotransferase, which confers resistance to the aminoglycosides neomycin, kanamycin and paromycin (Herrera-Estrella, EMBO J. 2:987-995, 1983) and hygromycin, which confers resistance to hygromycin (Marsh, Gene 32:481-485, 1984), trpB, which
20 allows cells to utilize indole in place of tryptophan; hisD, which allows cells to utilize histinol in place of histidine (Hartman, Proc. Natl. Acad. Sci., USA 85:8047, 1988); mannose-6-phosphate isomerase which allows cells to utilize mannose (WO 94/20627); ornithine decarboxylase, which confers resistance to the ornithine
25 decarboxylase inhibitor, 2-(difluoromethyl)-DL-ornithine (DFMO; McConlogue, 1987, In: Current Communications in Molecular Biology, Cold Spring Harbor Laboratory ed.); and deaminase from *Aspergillus terreus*, which confers resistance to Blasticidin S (Tamura, Biosci. Biotechnol. Biochem. 59:2336-2338, 1995). Additional selectable markers include those that confer herbicide resistance, for
30 example, phosphinothricin acetyltransferase gene, which confers resistance to phosphinothricin (White et al., Nucl. Acids Res. 18:1062, 1990; Spencer et al., Theor. Appl. Genet. 79:625-631, 1990), a mutant EPSPV-synthase, which confers glyphosate

resistance (Hinchee et al., Bio/Technology 91:915-922, 1998), a mutant acetolactate synthase, which confers imidazolinone or sulfonylurea resistance (Lee et al., EMBO J. 7:1241-1248, 1988), a mutant psbA, which confers resistance to atrazine (Smeda et al., Plant Physiol. 103:911-917, 1993), or a mutant protoporphyrinogen oxidase (see
5 U.S. Pat. No. 5,767,373), or other markers conferring resistance to an herbicide such as glufosinate. In addition, markers that facilitate identification of a plant cell containing the polynucleotide encoding the marker include, for example, luciferase (Giacomin, Plant Sci. 116:59-72, 1996; Scikantha, J. Bacteriol. 178:121, 1996), green fluorescent protein (Gerdes, FEBS Lett. 389:44-47, 1996) or fl-glucuronidase
10 (Jefferson, EMBO J. 6:3901-3907, 1997), and numerous others as disclosed herein or otherwise known in the art. Such markers also can be used as reporter molecules.

A heterologous nucleotide sequence can encode an antisense molecule, particularly an antisense molecule specific for a nucleotide sequence of a plant stress-regulated gene, for example, the gene from which the regulatory component of the
15 recombinant polynucleotide is derived. Such a recombinant polynucleotide can be useful for reducing the expression of a plant stress-regulated polypeptide in response to a stress condition because the antisense molecule, like the polypeptide, only will be induced upon exposure to the stress. A heterologous nucleotide sequence also can be, or can encode, a ribozyme or a triplexing agent. In addition to being useful as
20 heterologous nucleotide sequences, such molecules also can be used directly in a method of the invention, for example, to modulate the responsiveness of a plant cell to a stress condition. Thus, an antisense molecule, ribozyme, or triplexing agent can be contacted directly with a target cell and, upon uptake by the cell, can effect their antisense, ribozyme or triplexing activity; or can be encoded by a heterologous
25 nucleotide sequence that is expressed in a plant cell from a plant stress-regulated regulatory element, whereupon it can effect its activity.

An antisense polynucleotide, ribozyme or triplexing agent is complementary to a target sequence, which can be a DNA or RNA sequence, for example, messenger RNA, and can be a coding sequence, a nucleotide sequence comprising an intron-exon
30 junction, a regulatory sequence such as a Shine-Delgarno-like sequence, or the like. The degree of complementarity is such that the polynucleotide, for example, an antisense polynucleotide, can interact specifically with the target sequence in a cell.

Depending on the total length of the antisense or other polynucleotide, one or a few mismatches with respect to the target sequence can be tolerated without losing the specificity of the polynucleotide for its target sequence. Thus, few if any mismatches would be tolerated in an antisense molecule consisting, for example, of twenty
5 nucleotides, whereas several mismatches will not affect the hybridization efficiency of an antisense molecule that is complementary, for example, to the full length of a target mRNA encoding a cellular polypeptide. The number of mismatches that can be tolerated can be estimated, for example, using well known formulas for determining hybridization kinetics (see Sambrook et al., "Molecular Cloning; A Laboratory
10 Manual" 2nd Edition (Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY; 1989)) or can be determined empirically using methods as disclosed herein or otherwise known in the art, particularly by determining that the presence of the antisense polynucleotide, ribozyme, or triplexing agent in a cell decreases the level of the target sequence or the expression of a polypeptide encoded by the target sequence
15 in the cell.

A nucleotide sequence useful as an antisense molecule, a ribozyme or a triplexing agent can inhibit translation or cleave a polynucleotide encoded by plant stress-regulated gene, thereby modulating the responsiveness of a plant cell to a stress condition. An antisense molecule, for example, can bind to an mRNA to form a
20 double stranded molecule that cannot be translated in a cell. Antisense oligonucleotides of at least about 15 to 25 nucleotides are preferred since they are easily synthesized and can hybridize specifically with a target sequence, although longer antisense molecules can be expressed from a recombinant polynucleotide introduced into the target cell. Specific nucleotide sequences useful as antisense
25 molecules can be identified using well known methods, for example, gene walking methods (see, for example, Seimiya et al., J. Biol. Chem. 272:4631-4636 (1997), which is incorporated herein by reference). Where the antisense molecule is contacted directly with a target cell, it can be operatively associated with a chemically reactive group such as iron-linked EDTA, which cleaves a target RNA at the site of
30 hybridization. A triplexing agent, in comparison, can stall transcription (Maher et al., Antisense Res. Devel. 1:227 (1991); Helene, Anticancer Drug Design 6:569 (1991)).

A plant stress-regulated regulatory element can be included in an expression cassette. As used herein, the term "expression cassette" refers to a nucleotide sequence that can direct expression of an operatively linked polynucleotide. Thus, a plant stress-regulated regulatory element can constitute an expression cassette, or component thereof. An expression cassette is particularly useful for directing expression of a nucleotide sequence, which can be an endogenous nucleotide sequence or a heterologous nucleotide sequence, in a cell, particularly a plant cell. If desired, an expression cassette also can contain additional regulatory elements, for example, nucleotide sequences required for proper translation of a polynucleotide sequence into a polypeptide. In general, an expression cassette can be introduced into a plant cell such that the plant cell, a plant resulting from the plant cell, seeds obtained from such a plant, or plants produced from such seeds are resistant to a stress condition.

Additional regulatory sequences as disclosed above or other desirable sequences such as selectable markers or the like can be incorporated into an expression cassette containing a plant stress-regulated regulatory element (see, for example, WO 99/47552). Examples of suitable markers include dihydrofolate reductase (DHFR) or neomycin resistance for eukaryotic cells and tetracycline or ampicillin resistance for *E. coli*. Selection markers in plants include bleomycin, gentamycin, glyphosate, hygromycin, kanamycin, methotrexate, phleomycin, phosphinotricin, spectinomycin, streptomycin, sulfonamide and sulfonyleureas resistance (see, for example, Maliga et al., *Methods in Plant Molecular Biology*, Cold Spring Harbor Laboratory Press, 1995, page 39). The selection marker can have its own promoter or its expression can be driven by the promoter operably linked to the sequence of interest. Additional sequences such as intron sequences (e.g. from *Adh1* or *bronze1*) or viral leader sequences (e.g. from TMV, MCMV and AIVIV), all of which can enhance expression, can be included in the cassette. In addition, where it is desirable to target expression of a nucleotide sequence operatively linked to the stress-regulated regulatory element, a sequence encoding a cellular localization motif can be included in the cassette, for example, such that an encoded transcript or translation product is translocated to and localizes in the cytosol, nucleus, a chloroplast, or another subcellular organelle. Examples of useful transit peptides and transit peptide

sequences can be found in Von Heijne et al., Plant Mol. Biol. Rep. 9: 104, 1991; Clark et al., J. Biol. Chem. 264:17544, 1989; della Cioppa et al., Plant Physiol. 84:965, 1987; Romer et al., Biochem. Biophys. Res. Comm. 196:1414, 1993; Shah et al., Science 233:478, 1986; Archer et al., J. Bioenerg Biomemb. 22:789, 1990; Scandalios, Prog. Clin. Biol. Res. 344:515, 1990; Weisbeek et al., J. Cell Sci. Suppl. 11:199, 1989; Bruce, Trends Cell Biol. 10:440, 2000. The present invention can utilize native or heterologous transit peptides. The encoding sequence for a transit peptide can include all or a portion of the encoding sequence for a particular transit peptide, and may also contain portions of the mature protein encoding sequence associated with a particular transit peptide.

A polynucleotide portion of a plant stress-regulated plant gene, or an expression cassette, can be introduced into a cell as a naked DNA molecule, can be incorporated in a matrix such as a liposome or a particle such as a viral particle, or can be incorporated into a vector. Such vectors can be cloning or expression vectors, but other uses are within the scope of the present invention. A cloning vector is a self-replicating DNA molecule that serves to transfer a DNA segment into a host cell. The three most common types of cloning vectors are bacterial plasmids, phages, and other viruses. An expression vector is a cloning vector designed so that a coding sequence inserted at a particular site will be transcribed and translated into a protein. Incorporation of the polynucleotide into a vector can facilitate manipulation of the polynucleotide, or introduction of the polynucleotide into a plant cell. A vector can be derived from a plasmid or a viral vector such as a T-DNA vector (Horsch et al., Science 227:1229-1231, 1985, which is incorporated herein by reference). If desired, the vector can comprise components of a plant transposable element, for example, a Ds transposon (Bancroft and Dean, Genetics 134:1221-1229, 1993, which is incorporated herein by reference) or an Spm transposon (Aarts et al., Mol. Gen. Genet. 247:555-564, 1995, which is incorporated herein by reference).

In addition to containing the polynucleotide portion of a plant stress-regulated gene, a vector can contain various nucleotide sequences that facilitate, for example, rescue of the vector from a transformed plant cell; passage of the vector in a host cell, which can be a plant, animal, bacterial, or insect host cell; or expression of an encoding nucleotide sequence in the vector, including all or a portion of a rescued

coding region. As such, the vector can contain any of a number of additional transcription and translation elements, including constitutive and inducible promoters, enhancers, and the like (see, for example, Bitter et al., Meth. Enzymol. 153:516-544, 1987). For example, a vector can contain elements useful for passage, growth or
5 expression in a bacterial system, including a bacterial origin of replication; a promoter, which can be an inducible promoter; and the like. In comparison, a vector that can be passaged in a mammalian host cell system can have a promoter such as a metallothionein promoter, which has characteristics of both a constitutive promoter and an inducible promoter, or a viral promoter such as a retrovirus long terminal
10 repeat, an adenovirus late promoter, or the like. A vector also can contain one or more restriction endonuclease recognition and cleavage sites, including, for example, a polylinker sequence, to facilitate rescue of a nucleotide sequence operably linked to the polynucleotide portion.

The present invention also relates to a method of using a polynucleotide
15 portion of a plant stress-regulated gene to confer a selective advantage on a plant cell. Such a method can be performed by introducing, for example, a plant stress-regulated regulatory element into a plant cell, wherein, upon exposure of the plant cell to a stress condition to which the regulatory element is responsive, a nucleotide sequence operatively linked to the regulatory element is expressed, thereby conferring a
20 selective advantage to plant cell. The operatively linked nucleotide sequence can be a heterologous nucleotide sequence, which can be operatively linked to the regulatory element prior to introduction of the regulatory sequence into the plant cell; or can be an endogenous nucleotide sequence into which the regulatory element was targeted by a method such as homologous recombination. The selective advantage conferred by
25 the operatively linked nucleotide sequence can be such that the plant is better able to tolerate the stress condition; or can be any other selective advantage.

As used herein, the term "selective advantage" refers to the ability of a particular organism to better propagate, develop, grow, survive, or otherwise tolerate a condition as compared to a corresponding reference organism that does not contain
30 a plant-stress regulated polynucleotide portion of the present invention. In one embodiment, a selective advantage is exemplified by the ability of a desired plant, plant cell, or the like, that contains an introduced plant stress-regulated regulatory

element, to grow better than an undesired plant, plant cell, or the like, that does not contain the introduced regulatory element. For example, a recombinant polynucleotide comprising a plant stress-regulated regulatory element operatively linked to a heterologous nucleotide sequence encoding an enzyme that inactivates an herbicide can be introduced in a desired plant. Upon exposure of a mixed population of plants comprising the desired plants, which contain the recombinant polynucleotide, and one or more other populations of undesired plants, which lack the recombinant polynucleotide, to a stress condition that induces expression of the regulatory element and to the herbicide, the desired plants will have a greater likelihood of surviving exposure to the toxin and, therefore, a selective advantage over the undesired plants.

In another embodiment, a selective advantage is exemplified by the ability of a desired plant, plant cell, or the like, to better propagate, develop, grow, survive, or otherwise tolerate a condition as compared to an undesired plant, plant cell, or the like, that contains an introduced plant stress-regulated regulatory element. For example, a recombinant polynucleotide comprising a plant stress-regulated regulatory element operatively linked to a plant cell toxin can be introduced into cells of an undesirable plant present in a mixed population of desired and undesired plants, for example, food crops and weeds, respectively, then the plants can be exposed to stress conditions that induce expression from the plant stress-regulated regulatory element, whereby expression of the plant cell toxin results in inhibition of growth or death of the undesired plants, thereby providing a selective advantage to the desired plants, which no longer have to compete with the undesired plants for nutrients, light, or the like. In another example, a plant stress-regulated regulatory element operatively linked to a plant cell toxin can be introduced into cells of plants used as a nurse crop. Nurse crops, also called cover or companion crops, are planted in combination with plants of interest to provide, among other things, shade and soil stability during establishment of the desired plants. Once the desired plants have become established, the presence of the nurse crop may no longer be desirable. Exposure to conditions inducing expression of the gene linked to the plant stress-regulated regulatory element allows elimination of the nurse crop. Alternatively nurse crops can be made less tolerate to abiotic stress by the inhibition of any of the stress-regulated sequences

disclosed herein. Inhibition can be accomplished by any of the method described herein. Upon exposure of the nurse crop to the stress, the decreased ability of the nurse crop to respond to the stress will result in elimination of the nurse crop, leaving only the desired plants.

5 The invention also provides a means of producing a transgenic plant, which comprises plant cells that exhibit altered responsiveness to a stress condition. As such, the present invention further provides a transgenic plant, or plant cells or tissues derived therefrom, which are genetically modified to respond to stress differently than a corresponding wild-type plant or plant not containing constructs of the present
10 invention would respond. As used herein, the term "responsiveness to a stress condition" refers to the ability of a plant to express a plant stress-regulated gene upon exposure to the stress condition. A transgenic plant cell contains a polypeptide portion of a plant stress-regulated gene, or a mutant form thereof, for example, a knock-out mutant. A knock-out mutant form of a plant stress-regulated gene can
15 contain, for example, a mutation such that a STOP codon is introduced into the reading frame of the translated portion of the gene such that expression of a functional stress-regulated polypeptide is prevented; or a mutation in the stress-regulated regulatory element such that inducibility of the element in response to a stress condition is inhibited. Such transgenic plants of the invention can display any of
20 various idiotypic modifications in response to an abiotic stress, including altered tolerance to the stress condition, as well as increased or decreased plant growth, root growth, yield, or the like, as compared to the corresponding wild-type plant.

 The term "plant" is used broadly herein to include any plant at any stage of development, or to part of a plant, including a plant cutting, a plant cell, a plant cell
25 culture, a plant organ, a plant seed, and a plantlet. A plant cell is the structural and physiological unit of the plant, comprising a protoplast and a cell wall. A plant cell can be in the form of an isolated single cell or a cultured cell, or can be part of higher organized unit, for example, a plant tissue, plant organ, or plant. Thus, a plant cell can be a protoplast, a gamete producing cell, or a cell or collection of cells that can
30 regenerate into a whole plant. As such, a seed, which comprises multiple plant cells and is capable of regenerating into a whole plant, is considered plant cell for purposes of this disclosure. A plant tissue or plant organ can be a seed, protoplast, callus, or

any other groups of plant cells that is organized into a structural or functional unit. Particularly useful parts of a plant include harvestable parts and parts useful for propagation of progeny plants. A harvestable part of a plant can be any useful part of a plant, for example, flowers, pollen, seedlings, tubers, leaves, stems, fruit, seeds,
5 roots, and the like. A part of a plant useful for propagation includes, for example, seeds, fruits, cuttings, seedlings, tubers, rootstocks, and the like.

A transgenic plant can be regenerated from a transformed plant cell. As used herein, the term "regenerate" means growing a whole plant from a plant cell; a group of plant cells; a protoplast; a seed; or a piece of a plant such as a callus or tissue.

10 Regeneration from protoplasts varies from species to species of plants. For example, a suspension of protoplasts can be made and, in certain species, embryo formation can be induced from the protoplast suspension, to the stage of ripening and germination. The culture media generally contains various components necessary for growth and regeneration, including, for example, hormones such as auxins and cytokinins; and
15 amino acids such as glutamic acid and proline, depending on the particular plant species. Efficient regeneration will depend, in part, on the medium, the genotype, and the history of the culture. If these variables are controlled, however, regeneration is reproducible.

Regeneration can occur from plant callus, explants, organs or plant parts.
20 Transformation can be performed in the context of organ or plant part regeneration. (see Meth. Enzymol. Vol. 118; Klee et al. Ann. Rev. Plant Physiol. 38:467, 1987, which is incorporated herein by reference). Utilizing the leaf disk-transformation-regeneration method, for example, disks are cultured on selective media, followed by shoot formation in about two to four weeks (see Horsch et al., *supra*, 1985). Shoots
25 that develop are excised from calli and transplanted to appropriate root-inducing selective medium. Rooted plantlets are transplanted to soil as soon as possible after roots appear. The plantlets can be repotted as required, until reaching maturity.

In vegetatively propagated crops, the mature transgenic plants are propagated utilizing cuttings or tissue culture techniques to produce multiple identical plants.
30 Selection of desirable transgenotes is made and new varieties are obtained and propagated vegetatively for commercial use. In seed propagated crops, the mature transgenic plants can be self crossed to produce a homozygous inbred plant. The

resulting inbred plant produces seeds that contain the introduced plant stress-induced regulatory element, and can be grown to produce plants that express a polynucleotide or polypeptide in response to a stress condition that induces expression from the regulatory element. As such, the invention further provides seeds produced by a transgenic plant obtained by a method of the invention.

In addition, transgenic plants comprising different recombinant sequences can be crossbred, thereby providing a means to obtain transgenic plants containing two or more different transgenes, each of which contributes a desirable characteristic to the plant. Methods for breeding plants and selecting for crossbred plants having desirable characteristics or other characteristics of interest are well known in the art.

A method of the invention can be performed by introducing a polynucleotide portion of a plant stress-regulated gene into the plant. As used herein, the term "introducing" means transferring a polynucleotide into a plant cell. A polynucleotide can be introduced into a cell by a variety of methods well known to those of ordinary skill in the art. For example, the polynucleotide can be introduced into a plant cell using a direct gene transfer method such as electroporation or microprojectile mediated transformation, or using *Agrobacterium* mediated transformation. Non-limiting examples of methods for the introduction of polynucleotides into plants are provided in greater detail herein. As used herein, the term "transformed" refers to a plant cell containing an exogenously introduced polynucleotide portion of a plant stress-regulated gene that is or can be rendered active in a plant cell, or to a plant comprising a plant cell containing such a polynucleotide.

It should be recognized that one or more polynucleotides, which are the same or different can be introduced into a plant, thereby providing a means to obtain a genetically modified plant containing multiple copies of a single transgenic sequence, or containing two or more different transgenic sequences, either or both of which can be present in multiple copies. Such transgenic plants can be produced, for example, by simply selecting plants having multiple copies of a single type of transgenic sequence; by cotransfecting plant cells with two or more populations of different transgenic sequences and identifying those containing the two or more different transgenic sequences; or by crossbreeding transgenic plants, each of which contains

one or more desired transgenic sequences, and identifying those progeny having the desired sequences.

Methods for introducing a polynucleotide into a plant cell to obtain a transformed plant also include direct gene transfer (see European Patent A 164 575),
5 injection, electroporation, biolistic methods such as particle bombardment, pollen-mediated transformation, plant RNA virus-mediated transformation, liposome-mediated transformation, transformation using wounded or enzyme-degraded immature embryos, or wounded or enzyme-degraded embryogenic callus, and the like. Transformation methods using *Agrobacterium tumefaciens* tumor inducing (Ti)
10 plasmids or root-inducing (Ri) plasmids, or plant virus vectors are well known in the art (see, for example, WO 99/47552; Weissbach & Weissbach, "Methods for Plant Molecular Biology" (Academic Press, NY 1988), section VIII, pages 421-463; Grierson and Corey, "Plant Molecular Biology" 2d Ed. (Blackie, London 1988), Chapters 7-9, each of which is incorporated herein by reference; Horsch et al., *supra*,
15 1985). The wild-type form of *Agrobacterium*, for example, contains a Ti plasmid, which directs production of tumorigenic crown gall growth on host plants. Transfer of the tumor inducing T-DNA region of the Ti plasmid to a plant genome requires the Ti plasmid-encoded virulence genes as well as T-DNA borders, which are a set of direct DNA repeats that delineate the region to be transferred. An *Agrobacterium*
20 based vector is a modified form of a Ti plasmid, in which the tumor inducing functions are replaced by a nucleotide sequence of interest that is to be introduced into the plant host.

Methods of using *Agrobacterium* mediated transformation include cocultivation of *Agrobacterium* with cultured isolated protoplasts; transformation of
25 plant cells or tissues with *Agrobacterium*; and transformation of seeds, apices or meristems with *Agrobacterium*. In addition, *in planta* transformation by *Agrobacterium* can be performed using vacuum infiltration of a suspension of *Agrobacterium* cells (Bechtold et al., C.R. Acad. Sci. Paris 316:1194, 1993, which is incorporated herein by reference).

30 *Agrobacterium* mediated transformation can employ cointegrate vectors or binary vector systems, in which the components of the Ti plasmid are divided between a helper vector, which resides permanently in the *Agrobacterium* host and carries the

virulence genes, and a shuttle vector, which contains the gene of interest bounded by T-DNA sequences. Binary vectors are well known in the art (see, for example, De Framond, BioTechnology 1:262, 1983; Hoekema et al., Nature 303:179, 1983, each of which is incorporated herein by reference) and are commercially available
5 (Clontech; Palo Alto CA). For transformation, *Agrobacterium* can be cocultured, for example, with plant cells or wounded tissue such as leaf tissue, root explants, hypocotyledons, stem pieces or tubers (see, for example, Glick and Thompson, "Methods in Plant Molecular Biology and Biotechnology" (Boca Raton FL, CRC Press 1993), which is incorporated herein by reference). Wounded cells within the
10 plant tissue that have been infected by *Agrobacterium* can develop organs *de novo* when cultured under the appropriate conditions; the resulting transgenic shoots eventually give rise to transgenic plants, which contain an exogenous polynucleotide portion of a plant stress-regulated gene.

Agrobacterium mediated transformation has been used to produce a variety of
15 transgenic plants, including, for example, transgenic cruciferous plants such as *Arabidopsis*, mustard, rapeseed and flax; transgenic leguminous plants such as alfalfa, pea, soybean, trefoil and white clover; and transgenic solanaceous plants such as eggplant, petunia, potato, tobacco and tomato (see, for example, Wang et al., "Transformation of Plants and Soil Microorganisms" (Cambridge, University Press
20 1995), which is incorporated herein by reference). In addition, *Agrobacterium* mediated transformation can be used to introduce an exogenous polynucleotide sequence, for example, a plant stress-regulated regulatory element into apple, aspen, belladonna, black currant, carrot, celery, cotton, cucumber, grape, horseradish, lettuce, morning glory, muskmelon, neem, poplar, strawberry, sugar beet, sunflower, walnut,
25 asparagus, rice and other plants (see, for example, Glick and Thompson, *supra*, 1993; Hiei et al., Plant J. 6:271-282, 1994; Shimamoto, Science 270:1772-1773, 1995).

Suitable strains of *Agrobacterium tumefaciens* and vectors as well as transformation of *Agrobacteria* and appropriate growth and selection media are well known in the art (GV3101, pMK90RK), Koncz, Mol. Gen. Genet. 204:383-396, 1986; (C58C1, pGV3850kan), Deblaere, Nucl. Acid Res. 13:4777, 1985; Bevan, Nucl. Acid Res. 12:8711, 1984; Koncz, Proc. Natl. Acad. Sci. USA 86:8467-8471, 1986; Koncz, Plant Mol. Biol. 20:963-976, 1992; Koncz, Specialized vectors for gene tagging and
30

expression studies. In: Plant Molecular Biology Manual Vol. 2, Gelvin and Schilperoort (Eds.), Dordrecht, The Netherlands: Kluwer Academic Publ. (1994), 1-22; European Patent A-1 20 516; Hoekema: The Binary Plant Vector System, Offsetdrukkerij Kanters B. V., Alblasserdam (1985), Chapter V; Fraley, Crit. Rev. Plant. Sci., 4:1-46; An, EMBO J. 4:277-287, 1985).

Where a polynucleotide portion of a plant stress-regulated gene is contained in vector, the vector can contain functional elements, for example "left border" and "right border" sequences of the T-DNA of *Agrobacterium*, which allow for stable integration into a plant genome. Furthermore, methods and vectors that permit the generation of marker-free transgenic plants, for example, where a selectable marker gene is lost at a certain stage of plant development or plant breeding, are known, and include, for example, methods of co-transformation (Lyznik, Plant Mol. Biol. 13:151-161, 1989; Peng, Plant Mol. Biol. 27:91-104, 1995), or methods that utilize enzymes capable of promoting homologous recombination in plants (see, e.g., W097/08331; Bayley, Plant Mol. Biol. 18:353-361, 1992; Lloyd, Mol. Gen. Genet. 242:653-657, 1994; Maeser, Mol. Gen. Genet. 230:170-176, 1991; Onouchi, Nucl. Acids Res. 19:6373-6378, 1991; see, also, Sambrook et al., *supra*, 1989).

A direct gene transfer method such as electroporation also can be used to introduce a polynucleotide portion of a plant stress-regulated gene into a cell such as a plant cell. For example, plant protoplasts can be electroporated in the presence of the regulatory element, which can be in a vector (Fromm et al., Proc. Natl. Acad. Sci., USA 82:5824, 1985, which is incorporated herein by reference). Electrical impulses of high field strength reversibly permeabilize membranes allowing the introduction of the nucleic acid. Electroporated plant protoplasts reform the cell wall, divide and form a plant callus. Microinjection can be performed as described in Potrykus and Spangenberg (eds.), *Gene Transfer To Plants* (Springer Verlag, Berlin, NY 1995). A transformed plant cell containing the introduced polynucleotide can be identified by detecting a phenotype due to the introduced polynucleotide, for example, increased or decreased tolerance to a stress condition.

Microprojectile mediated transformation also can be used to introduce a polynucleotide into a plant cell (Klein et al., Nature 327:70-73, 1987, which is incorporated herein by reference). This method utilizes microprojectiles such as gold

or tungsten, which are coated with the desired nucleic acid molecule by precipitation with calcium chloride, spermidine or polyethylene glycol. The microprojectile particles are accelerated at high speed into a plant tissue using a device such as the BIOLISTIC PD-1000 (BioRad; Hercules CA).

5 Microprojectile mediated delivery ("particle bombardment") is especially useful to transform plant cells that are difficult to transform or regenerate using other methods. Methods for the transformation using biolistic methods are well known (Wan, Plant Physiol. 104:37-48, 1984; Vasil, Bio/Technology 11:1553-1558, 1993; Christou, Trends in Plant Science 1:423-431, 1996). Microprojectile mediated
10 transformation has been used, for example, to generate a variety of transgenic plant species, including cotton, tobacco, corn, hybrid poplar and papaya (see Glick and Thompson, *supra*, 1993). Important cereal crops such as wheat, oat, barley, sorghum and rice also have been transformed using microprojectile mediated delivery (Duan et al., Nature Biotech. 14:494-498, 1996; Shimamoto, Curr. Opin. Biotech. 5:158-162,
15 1994). A rapid transformation regeneration system for the production of transgenic plants such as a system that produces transgenic wheat in two to three months (see European Patent No. EP 0709462A2, which is incorporated herein by reference) also can be useful for producing a transgenic plant using a method of the invention, thus allowing more rapid identification of gene functions. The transformation of most
20 dicotyledonous plants is possible with the methods described above. Transformation of monocotyledonous plants also can be transformed using, for example, biolistic methods as described above, protoplast transformation, electroporation of partially permeabilized cells, introduction of DNA using glass fibers, *Agrobacterium* mediated transformation, and the like.

25 Plastid transformation also can be used to introduce a polynucleotide portion of a plant stress-regulated gene into a plant cell (U.S. Patent Nos. 5,451,513, 5,545,817, and 5,545,818; WO 95/16783; McBride et al., Proc. Natl. Acad. Sci., USA 91:7301-7305, 1994). Chloroplast transformation involves introducing regions of cloned plastid DNA flanking a desired nucleotide sequence, for example, a selectable
30 marker together with polynucleotide of interest into a suitable target tissue, using, for example, a biolistic or protoplast transformation method (e.g., calcium chloride or PEG mediated transformation). One to 1.5 kb flanking regions ("targeting

sequences") facilitate homologous recombination with the plastid genome, and allow the replacement or modification of specific regions of the plastome. Using this method, point mutations in the chloroplast 16S rRNA and rps12 genes, which confer resistance to spectinomycin and streptomycin, can be utilized as selectable markers for transformation (Svab et al., Proc. Natl. Acad. Sci., USA 87:8526-8530, 1990; Staub and Maliga, Plant Cell 4:39-45, 1992), resulted in stable homoplasomic transformants; at a frequency of approximately one per 100 bombardments of target leaves. The presence of cloning sites between these markers allowed creation of a plastid targeting vector for introduction of foreign genes (Staub and Maliga, EMBO J. 12:601-606, 1993). Substantial increases in transformation frequency are obtained by replacement of the recessive rRNA or r-protein antibiotic resistance genes with a dominant selectable marker, the bacterial aadA gene encoding the spectinomycin-detoxifying enzyme aminoglycoside-3'-adenyltransferase (Svab and Maliga, Proc. Natl. Acad. Sci., USA 90:913-917, 1993). Approximately 15 to 20 cell division cycles following transformation are generally required to reach a homoplastidic state. Plastid expression, in which genes are inserted by homologous recombination into all of the several thousand copies of the circular plastid genome present in each plant cell, takes advantage of the enormous copy number advantage over nuclear-expressed genes to permit expression levels that can readily exceed 10% of the total soluble plant protein.

Plants suitable to treatment according to a method of the invention can be monocots or dicots and include, but are not limited to, corn (*Zea mays*), *Brassica* sp. (e.g., *B. napus*, *B. rapa*, *B. juncea*), particularly those *Brassica* species useful as sources of seed oil, alfalfa (*Medicago sativa*), rice (*Oryza sativa*), rye (*Secale cereale*), sorghum (*Sorghum bicolor*, *Sorghum vulgare*), millet (e.g., pearl millet (*Pennisetum glaucum*), proso millet (*Panicum miliaceum*), foxtail millet (*Setaria italica*), finger millet (*Eleusine coracana*)), sunflower (*Helianthus annuus*), safflower (*Carthamus tinctorius*), wheat (*Triticum aestivum*), soybean (*Glycine max*), tobacco (*Nicotiana tabacum*), potato (*Solanum tuberosum*), peanuts (*Arachis hypogaea*), cotton (*Gossypium barbadense*, *Gossypium hirsutum*), sweet potato (*Ipomoea batatas*), cassava (*Manihot esculenta*), coffee (*Coffea* spp.), coconut (*Cocos nucifera*), pineapple (*Ananas comosus*), citrus trees (*Citrus* spp.), cocoa (*Theobroma cacao*), tea

- (*Camellia sinensis*), banana (*Musa* spp.), avocado (*Persea utilane*), fig (*Ficus casica*), guava (*Psidium guajava*), mango (*Mangifera indica*), olive (*Olea europaea*), papaya (*Carica papaya*), cashew (*Anacardium occidentale*), macadamia (*Macadamia integrifolia*), almond (*Prunus amygdalus*), sugar beets (*Beta vulgaris*), sugarcane (*Saccharum* spp.), oats, duckweed (*Lemna*), barley, tomatoes (*Lycopersicon esculentum*), lettuce (e.g., *Lactuca sativa*), green beans (*Phaseolus vulgaris*), lima beans (*Phaseolus limensis*), peas (*Lathyrus* spp.), and members of the genus *Cucumis* such as cucumber (*C. sativus*), cantaloupe (*C. cantalupensis*), and musk melon (*C. melo*).
- Ornamentals such as azalea (*Rhododendron* spp.), hydrangea (*Macrophylla hydrangea*), hibiscus (*Hibiscus rosasanensis*), roses (*Rosa* spp.), tulips (*Tulipa* spp.), daffodils (*Narcissus* spp.), petunias (*Petunia hybrida*), carnation (*Dianthus caryophyllus*), poinsettia (*Euphorbia pulcherrima*), and chrysanthemum are also included. Additional ornamentals within the scope of the invention include impatiens, Begonia, Pelargonium, Viola, Cyclamen, Verbena, Vinca, Tagetes, Primula, Saint Paulia, Agertum, Amaranthus, Antihirrhinum, Aquilegia, Cineraria, Clover, Cosmo, Cowpea, Dahlia, Datura, Delphinium, Gerbera, Gladiolus, Gloxinia, Hippeastrum, Mesembryanthemum, Salpiglossos, and Zinnia.
- Conifers that may be employed in practicing the present invention include, for example, pines such as loblolly pine (*Pinus taeda*), slash pine (*Pinus elliotii*), ponderosa pine (*Pinus ponderosa*), lodgepole pine (*Pinus contorta*), and Monterey pine (*Pinus radiata*), Douglas-fir (*Pseudotsuga menziesii*); Western hemlock (*Tsuga utilane*); Sitka spruce (*Picea glauca*); redwood (*Sequoia sempervirens*); true firs such as silver fir (*Abies amabilis*) and balsam fir (*Abies balsamea*); and cedars such as Western red cedar (*Thuja plicata*) and Alaska yellow-cedar (*Chamaecyparis nootkatensis*).

Leguminous plants which may be used in the practice of the present invention include beans and peas. Beans include guar, locust bean, fenugreek, soybean, garden beans, cowpea, mungbean, lima bean, fava bean, lentils, chickpea, etc. Legumes include, but are not limited to, *Arachis*, e.g., peanuts, *Vicia*, e.g., crown vetch, hairy vetch, adzuki bean, mung bean, and chickpea, *Lupinus*, e.g., lupine, trifolium, *Phaseolus*, e.g., common bean and lima bean, *Pisum*, e.g., field bean, *Melilotus*, e.g.,

clover, *Medicago*, e.g., alfalfa, Lotus, e.g., trefoil, lens, e.g., lentil, and false indigo.

Preferred forage and turf grass for use in the methods of the invention include alfalfa, orchard grass, tall fescue, perennial ryegrass, creeping bent grass, and redtop.

Other plants within the scope of the invention include *Acacia*, aneth, artichoke,
5 arugula, blackberry, canola, cilantro, clementines, escarole, eucalyptus, fennel, grapefruit, honey dew, jicama, kiwifruit, lemon, lime, mushroom, nut, okra, orange, parsley, persimmon, plantain, pomegranate, poplar, radiata pine, radicchio, Southern pine, sweetgum, tangerine, triticale, vine, yams, apple, pear, quince, cherry, apricot, melon, hemp, buckwheat, grape, raspberry, chenopodium, blueberry, nectarine, peach,
10 plum, strawberry, watermelon, eggplant, pepper, cauliflower, Brassica, e.g., broccoli, cabbage, utilian sprouts, onion, carrot, leek, beet, broad bean, celery, radish, pumpkin, endive, gourd, garlic, snapbean, spinach, squash, turnip, utilane, chicory, groundnut and zucchini.

Angiosperms are divided into two broad classes based on the number of
15 cotyledons, which are seed leaves that generally store or absorb food; a monocotyledonous angiosperm has a single cotyledon, and a dicotyledonous angiosperm has two cotyledons. Angiosperms produce a variety of useful products including materials such as lumber, rubber, and paper; fibers such as cotton and linen; herbs and medicines such as quinine and vinblastine; ornamental flowers such as
20 roses and orchids; and foodstuffs such as grains, oils, fruits and vegetables.

Angiosperms encompass a variety of flowering plants, including, for example, cereal plants, leguminous plants, oilseed plants, hardwood trees, fruit-bearing plants and ornamental flowers, which general classes are not necessarily exclusive. Cereal plants, which produce an edible grain cereal, include, for example, corn, rice, wheat,
25 barley, oat, rye, orchardgrass, guinea grass, sorghum and turfgrass. Leguminous plants include members of the pea family (*Fabaceae*) and produce a characteristic fruit known as a legume. Examples of leguminous plants include, for example, soybean, pea, chickpea, moth bean, broad bean, kidney bean, lima bean, lentil, cowpea, dry bean, and peanut, as well as alfalfa, birdsfoot trefoil, clover and sainfoin.
30 Oilseed plants, which have seeds that are useful as a source of oil, include soybean, sunflower, rapeseed (canola) and cottonseed.

Angiosperms also include hardwood trees, which are perennial woody plants that generally have a single stem (trunk). Examples of such trees include alder, ash, aspen, basswood (linden), beech, birch, cherry, cottonwood, elm, eucalyptus, hickory, locust, maple, oak, persimmon, poplar, sycamore, walnut, sequoia, and willow. Trees
5 are useful, for example, as a source of pulp, paper, structural material and fuel.

Angiosperms are fruit-bearing plants that produce a mature, ripened ovary, which generally contains seeds. A fruit can be suitable for human or animal consumption or for collection of seeds to propagate the species. For example, hops are a member of the mulberry family that are prized for their flavoring in malt liquor.
10 Fruit-bearing angiosperms also include grape, orange, lemon, grapefruit, avocado, date, peach, cherry, olive, plum, coconut, apple and pear trees and blackberry, blueberry, raspberry, strawberry, pineapple, tomato, cucumber and eggplant plants. An ornamental flower is an angiosperm cultivated for its decorative flower. Examples of commercially important ornamental flowers include rose, orchid, lily, tulip and
15 chrysanthemum, snapdragon, camellia, carnation and petunia plants. The skilled artisan will recognize that the methods of the invention can be practiced using these or other angiosperms, as desired, as well as gymnosperms, which do not produce seeds in a fruit.

A method of producing a transgenic plant can be performed by introducing a
20 polynucleotide portion of plant stress-regulated gene into a plant cell genome, whereby the polynucleotide portion of the plant stress-regulated gene modulates a response of the plant cell to a stress condition, thereby producing a transgenic plant, which comprises plant cells that exhibit altered responsiveness to the stress condition. In one embodiment, the polynucleotide portion of the plant stress-regulated gene
25 encodes a stress-regulated polypeptide or functional peptide portion thereof, wherein expression of the stress-regulated polypeptide or functional peptide portion thereof either increases the stress tolerance of the transgenic plant, or decreases the stress tolerance of the transgenic plant. The polynucleotide portion of the plant stress-regulated gene encoding the stress-regulated polypeptide or functional peptide portion
30 thereof can be operatively linked to a heterologous promoter.

In another embodiment, the polynucleotide portion of the plant stress-regulated gene comprises a stress-regulated regulatory element. The stress-regulated

regulatory element can integrate into the plant cell genome in a site-specific manner, whereupon it can be operatively linked to an endogenous nucleotide sequence, which can be expressed in response to a stress condition specific for the regulatory element; or can be a mutant regulatory element, which is not responsive to the stress condition, whereby upon integrating into the plant cell genome, the mutant regulatory element disrupts an endogenous stress-regulated regulatory element of a plant stress-regulated gene, thereby altering the responsiveness of the plant stress-regulated gene to the stress condition. Accordingly, the invention also provides genetically modified plants, including transgenic plants, produced by such a method, and a plant cell obtained from such genetically modified plant, wherein said plant cell exhibits altered responsiveness to the stress condition; a seed produced by a transgenic plant; and a cDNA library prepared from a transgenic plant.

Also provided is a method of modulating the responsiveness of a plant cell to a stress condition. Such a method can be performed, for example, by introducing a polynucleotide portion of a plant stress-regulated gene into the plant cell, thereby modulating the responsiveness of the plant cell to a stress condition. As disclosed herein, the responsiveness of the plant cell can be increased or decreased upon exposure to the stress condition, and the altered responsiveness can result in increased or decreased tolerance of the plant cell to a stress condition. The polynucleotide portion of the plant stress-regulated gene can, but need not, be integrated into the genome of the plant cell, thereby modulating the responsiveness of the plant cell to the stress condition. Accordingly, the invention also provide a genetically modified plant, including a transgenic plant, which contains an introduced polynucleotide portion of a plant stress-regulated gene, as well as plant cells, tissues, and the like, which exhibit modulated responsiveness to a stress condition.

The polynucleotide portion of the plant stress-regulated gene can encode a stress-regulated polypeptide or functional peptide portion thereof, which can be operatively linked to a heterologous promoter. As used herein, reference to a "functional peptide portion of a plant stress-regulated polypeptide" means a contiguous amino acid sequence of the polypeptide that has an activity of the full length polypeptide, or that has an antagonist activity with respect to the full length polypeptide, or that presents an epitope unique to the polypeptide. Thus, by

expressing a functional peptide portion of a plant stress-regulated polypeptide in a plant cell, the peptide can act as an agonist or an antagonist of the polypeptide, thereby modulating the responsiveness of the plant cell to a stress condition.

A polynucleotide portion of the plant stress-regulated nucleotide sequence also
5 can contain a mutation, whereby upon integrating into the plant cell genome, the
— polynucleotide disrupts (knocks-out) an endogenous plant stress-regulated nucleotide
sequence, thereby modulating the responsiveness of said plant cell to the stress
condition. Depending on whether the knocked-out gene encodes an adaptive or a
maladaptive stress-regulated polypeptide, the responsiveness of the plant will be
10 modulated accordingly. Thus, a method of the invention provides a means of
producing a transgenic plant having a knock-out phenotype of a plant stress-regulated
nucleotide sequence.

Alternatively, the responsiveness of a plant or plant cell to a stress condition
can be modulated by use of a suppressor construct containing dominant negative
15 mutation for any of the stress-regulated sequences described herein. Expression of a
suppressor construct containing a dominant mutant mutation generates a mutant
transcript that, when coexpressed with the wild-type transcript inhibits the action of
the wild-type transcript. Methods for the design and use of dominant negative
constructs are well known (see, for example, in Herskowitz, Nature 329:219-222,
20 1987; Lagna and Hemmati-Brivanlou, Curr. Topics Devel. Biol. 36:75-98, 1998).

The polynucleotide portion of the plant stress-regulated gene also can
comprise a stress-regulated regulatory element, which can be operatively linked to a
heterologous nucleotide sequence, which, upon expression from the regulatory
element in response to a stress condition, modulates the responsiveness of the plant
25 cell to the stress condition. Such a heterologous nucleotide sequence can encode, for
example, a stress-inducible transcription factor such as DREB1A, which, upon
exposure to the stress condition, is expressed such that it can amplify the stress
response (see Kasuga et al., *supra*, 1999). The heterologous nucleotide sequence also
can encode a polynucleotide that is specific for a plant stress-regulated gene, for
30 example, an antisense molecule, a ribozyme, and a triplexing agent, either of which,
upon expression in the plant cell, reduces or inhibits expression of a stress-regulated
polypeptide encoded by the gene, thereby modulating the responsiveness of the plant

cell to a stress condition, for example, an abnormal level of cold, osmotic pressure, and salinity. As used herein, the term "abnormal," when used in reference to a condition such as temperature, osmotic pressure, salinity, or any other condition that can be a stress condition, means that the condition varies sufficiently from a range generally considered optimum for growth of a plant that the condition results in an induction of a stress response in a plant. Methods of determining whether a stress response has been induced in a plant are disclosed herein or otherwise known in the art.

A plant stress-regulated regulatory element can be operatively linked to a heterologous polynucleotide sequence, such that the regulatory element can be introduced into a plant genome in a site-specific manner by homologous recombination. For example, a mutant plant stress-regulated regulatory element for a maladaptive stress-induced polypeptide can be transformed into a plant genome in a site specific manner by *in vivo* mutagenesis, using a hybrid RNA-DNA oligonucleotide ("chimeroplast" (TIBTECH 15:441- 447, 1997; W0 95/15972; Kren, Hepatology 25:1462-1468, 1997; Cole-Strauss, Science 273:1386-1389, 1996, each of which is incorporated herein by reference). Part of the DNA component of the RNA-DNA oligonucleotide is homologous to a nucleotide sequence comprising the regulatory element of the maladaptive gene, but includes a mutation or contains a heterologous region which is surrounded by the homologous regions. By means of base pairing of the homologous regions of the RNA-DNA oligonucleotide and of the endogenous nucleic acid molecule, followed by a homologous recombination the mutation contained in the DNA component of the RNA-DNA oligonucleotide or the heterologous region can be transferred to the plant genome, resulting in a "mutant" gene that, for example, is not induced in response to a stress and, therefore, does not confer the maladaptive phenotype. Such a method similarly can be used to knock-out the activity of a stress-regulated gene, for example, in an undesirable plant. Such a method can provide the advantage that a desirable wild-type plant need not compete with the undesirable plant, for example, for light, nutrients, or the like.

A method of modulating the responsiveness of a plant cell to a stress condition also can be performed by introducing a mutation in the chromosomal copy of a plant stress-regulated gene, for example, in the stress-regulated regulatory element, by

transforming a cell with a chimeric oligonucleotide composed of a contiguous stretch of RNA and DNA residues in a duplex conformation with double hairpin caps on the ends. An additional feature of the oligonucleotide is the presence of 2'-O- methylation at the RNA residues. The RNA/DNA sequence is designed to align with the sequence of a chromosomal copy of the target regulatory element and to contain the desired nucleotide change (see U.S. Pat. No. 5,501,967, which is incorporated herein by reference).

A plant stress-regulated regulatory element also can be operatively linked to a heterologous polynucleotide such that, upon expression from the regulatory element in the plant cell, confers a desirable phenotype on the plant cell. For example, the heterologous polynucleotide can encode an aptamer, which can bind to a stress-induced polypeptide. Aptamers are nucleic acid molecules that are selected based on their ability to bind to and inhibit the activity of a protein or metabolite. Aptamers can be obtained by the SELEX (Systematic Evolution of Ligands by Exponential Enrichment) method (see U.S. Pat. No. 5,270,163), wherein a candidate mixture of single stranded nucleic acids having regions of randomized sequence is contacted with a target, and those nucleic acids having a specific affinity to the target are partitioned from the remainder of the candidate mixture, and amplified to yield a ligand enriched mixture. After several iterations a nucleic acid molecule (aptamer) having optimal affinity for the target is obtained. For example, such a nucleic acid molecule can be operatively linked to a plant stress-regulated regulatory element and introduced into a plant. Where the aptamer is selected for binding to a polypeptide that normally is expressed from the regulatory element and is involved in an adaptive response of the plant to a stress, the recombinant molecule comprising the aptamer can be useful for inhibiting the activity of the stress-regulated polypeptide, thereby decreasing the tolerance of the plant to the stress condition.

The invention provides a genetically modified plant, which can be a transgenic plant, that is tolerant or resistant to a stress condition. As used herein, the term "tolerant" or "resistant," when used in reference to a stress condition of a plant, means that the particular plant, when exposed to a stress condition, shows less of an effect, or no effect, in response to the condition as compared to a corresponding reference plant (naturally occurring wild-type plant or a plant not containing a construct of the

present invention). As a consequence, a plant encompassed within the present invention grows better under more widely varying conditions, has higher yields and/or produces more seeds. Thus, a transgenic plant produced according to a method of the invention can demonstrate protection (as compared to a corresponding reference
5 plant) from a delay to complete inhibition of alteration in cellular metabolism, or reduced cell growth or cell death caused by the stress. Preferably, the transgenic plant is capable of substantially normal growth under environmental conditions where the corresponding reference plant shows reduced growth, metabolism or viability, or increased male or female sterility.

10 The determination that a plant modified according to a method of the invention has increased resistance to a stress-inducing condition can be made by comparing the treated plant with a control (reference) plant using well known methods. For example, a plant having increased tolerance to saline stress can be identified by growing the plant on a medium such as soil, which contains a higher
15 content of salt in the order of at least about 10% compared to a medium the corresponding reference plant is capable of growing on. Advantageously, a plant treated according to a method of the invention can grow on a medium or soil containing at least about 50%, or more than about 75%, particularly at least about more than 100%, and preferably more than about 200% salt than the medium or soil
20 on which a corresponding reference plant can grow. In particular, such a treated plant can grow on medium or soil containing at least 40 mM, generally at least 100 mM, particularly at least 200 mM, and preferably at least 300 mM salt, including, for example, a water soluble inorganic salt such as sodium sulfate, magnesium sulfate, calcium sulfate, sodium chloride, magnesium chloride, calcium chloride, potassium
25 chloride, or the like; salts of agricultural fertilizers, and salts associated with alkaline or acid soil conditions; particularly NaCl.

In another embodiment, the invention provides a plant that is less tolerant or less resistant to a stress condition as compared to a corresponding reference plant. As used herein, the term "less tolerant" or "less resistant," when used in reference to a
30 stress condition of a plant, means that the particular plant, when exposed to a stress condition, shows an alteration in response to the condition as compared to a corresponding reference plant. As a consequence, such a plant, which generally is an

undesirable plant species, is less likely to grow when exposed to a stress condition than an untreated plant.

The present invention also relates to a method of expressing a heterologous nucleotide sequence in a plant cell. Such a method can be performed, for example, by introducing into the plant cell a plant stress-regulated regulatory element operatively linked to the heterologous nucleotide sequence, whereby, upon exposure of the plant cell to stress condition, the heterologous nucleotide sequence is expressed in the plant cell. The heterologous nucleotide sequence can encode a selectable marker, or preferably, a polypeptide that confers a desirable trait upon the plant cell, for example, a polypeptide that improves the nutritional value, digestibility or ornamental value of the plant cell, or a plant comprising the plant cell. Accordingly, the invention provides a transgenic plant that, in response to a stress condition, can produce a heterologous polypeptide from a plant stress-regulated regulatory element. Such transgenic plants can provide the advantage that, when grown in a cold environment for example, expression of the heterologous polypeptide from a plant cold-regulated regulatory element can result in increased nutritional value of the plant.

The present invention further relates to a method of modulating the activity of a biological pathway in a plant cell, wherein the pathway involves a stress-regulated polypeptide. As used herein, reference to a pathway that "involves" a stress-regulated polypeptide means that the polypeptide is required for normal function of the pathway. For example, plant stress-regulated polypeptides as disclosed herein include those acting as kinases or as transcription factors, which are well known to be involved in signal transduction pathways. As such, a method of the invention provides a means to modulate biological pathways involving plant stress-regulated polypeptides, for example, by altering the expression of the polypeptides in response to a stress condition. Thus, a method of the invention can be performed, for example, by introducing a polynucleotide portion of a plant stress-regulated gene into the plant cell, thereby modulating the activity of the biological pathway.

A method of the invention can be performed with respect to a pathway involving any of the stress-regulated polypeptides as encoded by a polynucleotide of SEQ ID NOS:1-2703, including for example, a stress-regulated transcription factor, an enzyme, including a kinase, a channel protein (see, for example, Tables 29-31; see,

also, Table 1). Pathways in which the disclosed stress-regulated stress factors are involved can be identified, for example, by searching the Munich Information Center for Protein Sequences (MIPS) *Arabidopsis thaliana* database (MATDB), which is at <http://www.mips.biochem.mpg.de/proj/thal/>.

5 The present invention also relates to a method of identifying a polynucleotide that modulates a stress response in a plant cell. Such a method can be performed, for example, by contacting an array of probes representative of a plant cell genome and nucleic acid molecules expressed in plant cell exposed to the stress; detecting a nucleic acid molecule that is expressed at a level different from a level of expression
10 in the absence of the stress; introducing the nucleic acid molecule that is expressed differently into a plant cell; and detecting a modulated response of the plant cell containing the introduced nucleic acid molecule to a stress, thereby identifying a polynucleotide that modulates a stress response in a plant cell. The contacting is under conditions that allow for selective hybridization of a nucleic acid molecule with
15 probe having sufficient complementarity, for example, under stringent hybridization conditions.

 As used herein, the term "array of probes representative of a plant cell genome" means an organized group of oligonucleotide probes that are linked to a solid support, for example, a microchip or a glass slide, wherein the probes can
20 hybridize specifically and selectively to nucleic acid molecules expressed in a plant cell. Such an array is exemplified herein by a GeneChip[®] Arabidopsis Genome Array (Affymetrix; see Example 1). In general, an array of probes that is "representative" of a plant genome will identify at least about 30% or the expressed nucleic acid molecules in a plant cell, generally at least about 50% or 70%, particularly at least
25 about 80% or 90%, and preferably will identify all of the expressed nucleic acid molecules. It should be recognized that the greater the representation, the more likely all nucleotide sequences of cluster of stress-regulated genes will be identified.

 A method of the invention is exemplified in Example 1, wherein clusters of *Arabidopsis* genes induced to cold, to increased salinity, to increased osmotic
30 pressure, and to a combination of the above three stress conditions were identified. Based on the present disclosure, the artisan readily can obtain nucleic acid samples for *Arabidopsis* plants exposed to other stress conditions, or combinations of stress

conditions, and identify clusters of genes induced in response to the stress conditions. Similarly, the method is readily adaptable to identifying clusters of stress-regulated genes expressed in other plant species, particularly commercially valuable plant species, where a substantial amount of information is known regarding the genome.

5 The clusters of genes identified herein include those clusters of genes that are induced or repressed in response to a combination of stress conditions, but not to any of the stress conditions alone; and clusters of genes that are induced or repressed in response to a selected stress condition, but not to other stress conditions tested. Furthermore, clusters of genes that respond to a stress condition in a temporally
10 regulated manner are also included, such as gene clusters that are induced early (for example, within about 3 hours), late (for example, after about 8 to 24 hours), or continuously in a stress response. In addition, the genes within a cluster are represented by a variety of cellular proteins, including transcription factors, enzymes such as kinases, channel proteins, and the like (see Tables 1 and 29-31). Thus, the
15 present invention further characterizes nucleotide sequences that previously were known to encode cellular peptides by classifying them within clusters of stress-regulated genes.

 The present invention additionally relates to a method of identifying a stress condition to which a plant cell was exposed. Such a method can be performed, for
20 example, by contacting nucleic acid molecules expressed in the plant cell and an array of probes representative of the plant cell genome; and detecting a profile of expressed nucleic acid molecules characteristic of a stress response, thereby identifying the stress condition to which the plant cell was exposed. The contacting generally is under conditions that allow for selective hybridization of a nucleic acid molecule with
25 probe having sufficient complementarity, for example, under stringent hybridization conditions. The profile can be characteristic of exposure to a single stress condition, for example, an abnormal level of cold, osmotic pressure, or salinity (Tables 3-14), or can be characteristic of exposure to more than one stress condition (Tables 15-26, for example, cold, increased osmotic pressure and increased salinity (see Tables 24-26).

30 The method can be practiced using at least one nucleic acid probe and can identify one or combination of stress conditions by detecting altered expression of one or a plurality of polynucleotides representative of plant stress-regulated genes. As

used herein, the term "at least one" includes one, two, three or more, for example, five, ten, twenty, fifty or more polynucleotides, nucleic acid probes, and the like. The term "plurality" is used herein to mean two or more, for example, three, four, five or more, including ten, twenty, fifty or more polynucleotides, nucleic acid probes, and
5 the like.

In a method of the invention, nucleic acid samples from the plant cells to be collected can be contacted with an array, then the profile can be compared with known expression profiles prepared from nucleic acid samples of plants exposed to a known stress condition or combination of stress conditions. By creating a panel of
10 such profiles, representative of various stress conditions, an unknown stress condition to which a plant was exposed can be identified simply by comparing the unknown profile with the known profiles and determining which known profile that matches the unknown profile. Preferably, the comparison is automated. Such a method can be useful, for example, to identify a cause of damage to a crop, where the condition
15 causing the stress is not known or gradually increases over time. For example, accumulation in soils over time of salts from irrigation water can result in gradually decreasing crop yields. Because the accumulation is gradual, the cause of the decreased yield may not be readily apparent. Using the present methods, it is possible to evaluate the stress to which the plants are exposed, thus revealing the cause of the
20 decreased yields.

The present invention, therefore includes a computer readable medium containing executable instructions for receiving expression data for sequences substantially similar to any of those disclosed herein and comparing expression data from a test plant to a reference plant that has been exposed to an abiotic stress. Also
25 provided is a computer-readable medium containing sequence data for sequences substantially similar to any of the sequences described herein, or the complements thereof, and a module for comparing such sequences to other nucleic acid sequences.

Also provided are plants and plant cells comprising plant stress-regulatory elements of the present invention operably linked to a nucleotide sequence encoding a
30 detectable signal. Such plants can be used as diagnostic or "sentinel" plants to provide early warning that nearby plants are being stressed so that appropriate actions can be taken. In one embodiment, the signal is one that alters the appearance of the

plant. For example, an osmotic stress regulatory element of the present invention can be operably linked to a nucleotide sequence encoding a fluorescent protein such as green fluorescent protein. When subjected to osmotic stress, the expression of the green fluorescent protein in the sentinel plant provides a visible signal so that appropriate actions can be taken to remove or alleviate the stress. The use of fluorescent proteins in plants is well known (see, for example, in Leffel et al., BioTechniques 23:912, 1997).

The invention further relates to a method of identifying an agent that modulates the activity of a stress-regulated regulatory element of a plant. As used herein, the term "modulate the activity," when used in reference to a plant stress-regulated regulatory element, means that expression of a polynucleotide from the regulatory element is increased or decreased. In particular, expression can be increased or decreased with respect to the basal activity of the promoter, i.e., the level of expression, if any, in the absence of a stress condition that normally induces expression from the regulatory element; or can be increased or decreased with respect to the level of expression in the presence of the inducing stress condition. As such, an agent can act as a mimic of a stress condition, or can act to modulate the response to a stress condition.

Such a method can be performed, for example, by contacting the regulatory element with an agent suspected of having the ability to modulate the activity of the regulatory element, and detecting a change in the activity of the regulatory element. In one embodiment, the regulatory element can be operatively linked to a heterologous polynucleotide encoding a reporter molecule, and an agent that modulates the activity of the stress-regulated regulatory element can be identified by detecting a change in expression of the reporter molecule due to contacting the regulatory element with the agent. Such a method can be performed *in vitro* in a plant cell-free system, or in a plant cell in culture or in a plant *in situ*.

A method of the invention also can be performed by contacting the agent is contacted with a genetically modified cell or a transgenic plant containing an introduced plant stress-regulated regulatory element, and an agent that modulates the activity of the regulatory element is identified by detecting a phenotypic change in the modified cell or transgenic plant.

A method of the invention can be performed in the presence or absence of the stress condition to which the particularly regulatory element is responsive. As such, the method can identify an agent that modulates the activity of plant stress-regulated promoter in response to the stress, for example, an agent that can enhance the stress response or can reduce the stress response. In particular, a method of the invention can identify an agent that selectively activates the stress-regulated regulatory elements of a cluster of plant stress-regulated genes, but does not affect the activity of other stress-regulated regulatory genes. As such, the method provides a means to identify an agent that acts as a stress mimic. Such agents can be particularly useful to prepare a plant to an expected stress condition. For example, a agent that acts as a cold mimic can be applied to a field of plants prior to the arrival of an expected cold front. Thus, the cold stress response can be induced prior to the actual cold weather, thereby providing the plants with the protection of the stress response, without the plants suffering from any initial damage due to the cold. Similarly, an osmotic pressure mimic can be applied to a crop of plants prior a field being flooded by a rising river.

In one embodiment, the present invention provides a method for marker-assisted selection. Marker-assisted selection involves the selection of plants having desirable phenotypes based on the presence of particular nucleotide sequences ("markers"). The use of markers allows plants to be selected early in development, often before the phenotype would normally be manifest. Because it allows for early selection, marker-assisted selection decreases the amount of time need for selection and thus allows more rapid genetic progress.

Briefly, marker-assisted selection involves obtaining nucleic acid from a plant to be selected. The nucleic acid obtained is then probed with probes that selectively hybridize under stringent, preferably highly stringent, conditions to a nucleotide sequence or sequences associated with the desired phenotype. In one embodiment, the probes hybridize to any of the stress-responsive genes or regulatory regions disclosed herein, for example, any one of SEQ ID NOS:1-2703. The presence of any hybridization products formed is detected and plants are then selected on the presence or absence of the hybridization products.

The following examples are intended to illustrate but not limit the invention.

EXAMPLE 1**PROFILING OF PLANT STRESS-REGULATED GENES**

This example demonstrates that clusters of stress-regulated genes can be identified in plant cells exposed to various stress conditions, either alone or in combination.

A GeneChip® Arabidopsis Genome Array (Affymetrix, Santa Clara, CA) was used to identify clusters of genes that were coordinately induced in response to various stress conditions. The GeneChip® Arabidopsis Genome Array contains probes synthesized *in situ* and is designed to measure temporal and spatial gene expression of approximately 8700 genes in greater than 100 EST clusters. The sequences used to develop the array were obtained from GenBank (<http://www.ncbi.nlm.nih.gov/>) in collaboration with Torrey Mesa Research Institute (San Diego, CA), formerly known as Novartis Agriculture Discovery Institute. Eighty percent of the nucleotide sequences represented on the array are predicted coding sequences from genomic BAC entries; twenty percent are high quality cDNA sequences. The array also contains over 100 EST clusters that share homology with the predicted coding sequences from BAC clones (see, for example, world wide web at address (url) "affymetrix.com/products/Arabidopsis_content.html").

The Affymetrix GeneChip® array was used to define nucleotide sequences/pathways affected by various abiotic stresses and to define which are uniquely regulated by one stress and those that respond to multiple stress, and to identify candidate nucleotide sequences for screening for insertional mutants. Of the approximately 8,700 nucleotide sequences represented on the Affymetrix GeneChip® array, 2862 nucleotide sequences showed at least a 2-fold change in expression in at least one sample, relative to no-treatment controls. Of those 2,862 nucleotide sequences 1,335 were regulated only by cold stress, 166 were regulated only mannitol stress and 209 were regulated only by saline stress. Furthermore, of the 2,862 nucleotide sequences 123 nucleotide sequences were regulated by salt and mannitol stress, 293 were regulated by mannitol and cold stress, 274 were regulated by cold and saline stress and 462 were regulated by cold, mannitol and salt. Of the 2,862 nucleotide sequences, 771 passed the higher stringency of showing at least a

2-fold change in expression in at least 2 samples, relative to control. And, 508 of the 771 nucleotide sequences were found in an in-house collection of insertion mutants.

The following describes in more detail how the experiments were done.

Transcriptional profiling was performed by hybridizing fluorescence labeled cRNA with
5 the oligonucleotides probes on the chip, washing, and scanning. Each gene is represented on the chip by about sixteen oligonucleotides (25-mers). Expression level is related to fluorescence intensity. Starting material contained 1 to 10 Tg total RNA; detection specificity was about $1:10^6$; approximately a 2-fold change was detectable, with less than 2% false positive; the dynamic range was approximately 500x.
10 Nucleotide sequences having up to 70% to 80% identity could be discriminated using this system.

Seven day old axenic *Arabidopsis* seedlings were transferred to Magenta boxes with rafts floating on MS medium. Three weeks later (28 day old seedlings), stresses were applied as follows: Control - no treatment; Cold - Magenta box placed in ice;
15 Mannitol - medium + 200 mM mannitol; Salt - medium + 100 mM NaCl. Tissue samples were collected at 3 hours and 27 hours into the stress, roots and aerial portions were harvested, RNA was purified, and the samples were analyzed using the GeneChip® *Arabidopsis* Genome Array (Affymetrix, Santa Clara, CA) following the manufacturer's protocol.

20 Raw fluorescence values as generated by Affymetrix software were processed as follows: the values were brought into Microsoft Excel and values of 25 or less were set to 25 (an empirically determined baseline, Zhu and Wang, Plant Physiol. 124:1472-1476; 2000). The values from the stressed samples were then converted to fold change relative to control by dividing the values from the stressed samples by the values from
25 the no-treatment control samples. Expression patterns that were altered at least 2-fold with respect to the control were selected. This method gave very robust results and resulted in a larger number of nucleotide sequences called as stress-regulated than previous methods had permitted.

Based on the profiles obtained following hybridization of nucleic acid molecules
30 obtained from plant cells exposed to various stress conditions to the probes in the microarray, clusters of nucleotide sequences that were altered in response to the stress

conditions were identified (see Tables 3-6, cold responsive; Tables 7-10, salt (saline) responsive; Tables 11 to 14, mannitol (osmotic) responsive; Tables 15-17, cold and mannitol responsive; Tables 18-20, salt and cold responsive; Tables 21-23, salt and mannitol responsive; Tables 24-26, cold, salt and mannitol responsive. Examples of plant gene sequences that varied in expression at least two-fold in response to a combination of cold, saline and osmotic stress in root cells and leaf cells are shown in Tables 27 and 28, respectively. In addition, examples of plant gene sequences that encode transcription factors (Table 29), phosphatases (Table 30), and kinases (Table 31) and that varied at least two-fold in response to a combination of cold, saline and osmotic stress are provided.

Affymetrix ID numbers and corresponding SEQ ID NOS: for the respective *Arabidopsis* nucleotide sequences are provided Tables 3-26, and can be used to determine SEQ ID NOS: for the sequences shown by Affymetrix ID number in Tables 27-31. The Affymetrix ID number refers to a particular nucleotide sequence on the GeneChip® *Arabidopsis* Genome Array. In some cases, a particular plant stress-regulated gene sequence hybridized to more than one nucleotide sequence on the GeneChip® *Arabidopsis* Genome Array (see, for example, Table 3, where SEQ ID NO:36 is shown to have hybridized to the 12187_AT and 15920_I_AT nucleotide sequences on the GeneChip®). In addition, it should be recognized that the disclosed sequences are not limited to coding sequences but, in some cases, include 5' untranslated sequences (see Table 2) or a longest coding region. As such, while the sequences set forth as SEQ ID NOS:1-2073 generally start with an ATG codon, in most cases each comprises a longer nucleotide sequence, including a regulatory region (see Table 2).

The results disclosed herein demonstrate that several polynucleotides, some of which were known to function as transcription factors, enzymes, and structural proteins, also are involved in the response of a plant cell to stress. The identification of the clusters of stress-regulated genes as disclosed herein provides a means to identify stress-regulated regulatory elements present in *Arabidopsis thaliana* nucleotide sequences, including consensus regulatory elements. It should be recognized, however that the regulatory elements of the plant genes comprising a sequence as set forth in SEQ ID NOS:156, 229, 233, 558, 573, 606, 625, 635, 787, and 813, which previously have

been described as cold regulated genes, are not encompassed within the stress-regulated gene regulatory element of the invention, and the regulatory elements of the plant genes comprising the nucleotide sequences set forth as SEQ ID NOS:1263, 1386, 1391, 1405, 1445, 1484, 1589, 1609, 1634, 1726, 1866, 1918, and 1928, which
5 previously have been identified as genes that are responsive to a single stress condition such as cold or saline stress, are not encompassed within the plant stress-regulated gene regulatory elements of the invention to the extent that they confer stress-regulated expression only with respect to the known single stress. Furthermore, the identification of the *Arabidopsis* stress-regulated genes provides a means to identify
10 the corresponding homologs and orthologs in other plants, including commercially valuable food crops such as wheat, rice, soy, and barley, and ornamental plants. BLASTN and BLASTP searches to identify such sequences revealed the polynucleotide sequences set forth in Table 32.

Although the invention has been described with reference to the above example,
15 it will be understood that modifications and variations are encompassed within the spirit and scope of the invention. Accordingly, the invention is limited only by the claims, which follow Tables 1 to 32.

TABLE 1

SEQUENCE DESCRIPTIONS			
Seq ID	Description		
1	unknown protein	41	scarecrow-like 7 (SCL7)
2	unknown protein	42	putative protein
3	unknown protein	43	No function assigned by TIGR
4	putative auxin-induced protein	44	unknown protein
5	unknown protein	45	unknown protein
6	hypothetical protein	SEQ ID	Description
7	putative protein	46	succinyl-CoA-ligase alpha subunit
8	unknown protein	47	putative protein
9	unknown protein	48	CLV1 receptor kinase like protein
10	unknown protein	49	putative receptor-like protein kinase
11	putative protein	50	putative squalene synthase
12	Thioredoxin - like protein	51	putative receptor protein kinase
13	putative RNA helicase	52	somatic embryogenesis receptor-like kinase, putative
14	putative protein	53	putative protein
15	putative protein	54	putative beta-glucosidase
16	RING zinc finger protein, putative	55	multi-drug resistance protein
17	putative cyclin	56	receptor protein kinase (TMK1), putative
18	putative protein	57	putative receptor-like protein kinase
19	putative protein	58	putative pectate lyase
20	unknown protein	59	putative protein kinase
21	putative protein	60	putative peroxidase
22	putative protein	61	cytochrome P450-like protein
23	hypothetical protein	62	putative beta-amylase
24	unknown protein	63	monosaccharide transporter STP3
25	hypothetical protein	64	Lycopersicon esculentum proteinase TMP, Pir2:T07617
26	unknown protein	65	putative receptor-like protein kinase
27	unknown protein	66	G-box-binding factor 1
28	unknown protein	67	amino acid carrier, putative
29	unknown protein	68	myb-related protein
30	putative protein	69	No function assigned by TIGR
31	putative protein	70	SNF1 like protein kinase
32	putative protein	71	Cu/Zn superoxide dismutase-like protein
33	unknown protein	72	putative protein kinase
34	putative ribonuclease III	73	small nuclear ribonucleoprotein U1A
35	unknown protein		
36	unknown protein		
37	unknown protein		
38	unknown protein		
39	unknown protein		
40	putative histidine kinase		

TABLE 1 (cont)

74	ras-like GTP-binding protein	101	dynein light chain like protein
75	oleoyl-[acyl-carrier-protein] hydrolase-like protein	102	chaperonin CPN10
76	putative heat shock transcription factor	103	putative bHLH transcription factor
77	putative protein	104	putative glyoxysomal malate dehydrogenase precursor
78	membrane-bound small GTP-binding - like protein	105	ATP-dependent RNA helicase, putative
79	putative protein (fragment)	106	chlorophyll synthetase
80	indole-3-acetate beta-glucosyltransferase like protein	107	similar to epoxide hydrolases
81	HD-zip transcription factor (athb-8)	108	putative protein
82	putative cAMP-dependent protein kinase	109	unknown protein
83	glucuronosyl transferase-like protein	110	hypothetical protein
84	putative leucine-rich repeat disease resistance protein	111	putative membrane transporter
85	98b like protein	112	putative tyrosyl-tRNA synthetase
86	putative receptor-like protein kinase	113	ARGININE/SERINE-RICH SPLICING FACTOR RSP31
87	IAA-Ala hydrolase (IAR3)	114	putative oxidoreductase
88	putative AP2 domain transcription factor	115	unknown protein
89	putative expansin	116	linker histone protein, putative
90	putative Ap2 domain protein	117	hypothetical protein
91	expansin (At-EXP1)	118	putative protein
92	cytochrome P450 - like protein	119	putative mitochondrial carrier protein
93	putative ATP-dependent RNA helicase A	120	putative transcription factor
94	unknown protein	121	MYB-related protein
95	predicted protein	122	myb-related transcription factor, putative
96	putative glucosyltransferase	123	unknown protein
97	unknown protein	124	unknown protein
98	putative xyloglucan-specific glucanase	125	putative glycine-rich protein
99	cysteine synthase	126	No function assigned by TIGR
100	clathrin assembly protein AP19 homolog	127	unknown protein
		128	unknown protein
		129	unknown protein
		130	unknown protein
		131	putative membrane channel protein
		132	putative protein
		133	unknown protein
		134	gamma glutamyl hydrolase, putative
		135	40S ribosomal protein S5
		136	DnaJ-like protein
		137	40S ribosomal protein S26
		138	putative WRKY-type DNA binding protein

TABLE 1 (cont)

139	putative protein	161	putative photomorphogenesis repressor protein
140	hypothetical protein	162	SNF1-like protein kinase (AKin11)
141	putative ubiquitin-conjugating enzyme	163	thioredoxin h
142	peptidylprolyl isomerase	164	thioredoxin
ROC1		165	Ca ²⁺ -dependent lipid-binding protein, putative
143	glyceraldehyde-3-phosphate dehydrogenase C subunit (GapC)	166	putative auxin-induced protein
144	No function assigned by TIGR	167	putative bZIP transcription factor
145	putative protein	168	hypothetical protein
146	putative thioredoxin	169	putative AVR9 elicitor response protein
147	thioredoxin h, putative	170	putative serine/threonine protein kinase
148	thioredoxin-like	171	bZIP transcription factor ATB2
149	allene oxide synthase (emb CAA73184.1)	172	putative spliceosome associated protein
150	anthranilate synthase component I-1 precursor (sp P32068)	173	3-hydroxyisobutyryl-coenzyme A hydrolase - like protein
151	CELL DIVISION CONTROL PROTEIN 2 HOMOLOG A	174	putative protein
152	protein kinase cdc2 homolog B	175	putative Mutator-like transposase
153	ethylene responsive element binding factor 1 (frameshift !)	176	putative protein
154	ethylene responsive element binding factor 2 (ATERF2) (sp O80338)	177	unknown protein
155	ethylene responsive element binding factor 5 (ATERF5) (sp O80341)	178	putative protein
156	glucose-6-phosphate dehydrogenase	179	putative protein
157	photomorphogenesis repressor (COP1)	180	putative galactinol synthase
158	unknown protein	181	putative transcriptional regulator
159	DNA (cytosine-5)-methyltransferase (DNA methyltransferase) (DNA metase) (sp P34881)	182	nuclear matrix constituent protein 1 (NMCP1)-like
160	PROLIFERA	183	putative DNA-binding protein RAV2
		184	No function assigned by TIGR
		185	basic blue protein, 5' partial
		186	unknown protein
		187	putative calcium-binding protein, calreticulin
		188	putative pyrophosphate-fructose-6-phosphate 1-phosphotransferase
		189	ribosomal protein L11, cytosolic
		190	putative dTDP-glucose 4-6-dehydratase
		191	40S ribosomal protein S20-like protein
		192	60S ribosomal protein L24

TABLE 1 (cont)

193	coatomer-like protein, epsilon subunit	223	putative SF16 protein {Helianthus annuus}
194	glycoprotein(EP1), putative	224	unknown protein
195	putative SPL1-related protein	225	thioredoxin
196	unknown protein	226	trehalose-6-phosphate phosphatase (AtTPPB)
197	putative transport protein SEC61 beta-subunit	227	chlorophyll a/b-binding protein
198	unknown protein	228	class IV chitinase (CHIV)
199	putative cytochrome P450	229	chalcone synthase (naringenin-chalcone synthase) (testa 4 protein) (sp P13114)
200	UTP-glucose glucosyltransferase - like protein	230	unknown protein
201	60S ribosomal protein L23	231	cinnamyl-alcohol dehydrogenase ELI3-2
202	40S ribosomal protein S17	232	farnesyl-pyrophosphate synthetase FPS2
203	40S ribosomal protein S26	233	phospholipid hydroperoxide glutathione peroxidase
204	protein translation factor Sui1 homolog, putative	234	heat shock transcription factor HSF4
205	unknown protein	235	heat shock protein 101
206	gamma glutamyl hydrolase, putative	236	17.6 kDa heat shock protein (AA 1-156)
207	dTDP-glucose 4,6-dehydratase, putative	237	heat shock protein 17.6A
208	extensin - like protein	238	heat-shock protein
209	unknown protein	239	HY5
210	protein phosphatase 2C - like protein	240	putative auxin-induced protein, IAA12
211	ubiquitin-like protein	241	early auxin-induced protein, IAA19
212	protein phosphatase 2C-like protein	242	auxin-inducible gene (IAA2)
213	unknown protein	243	putative protein
214	putative RING zinc finger ankyrin protein	244	putative choline kinase
215	unknown protein	245	thymidylate kinase - like protein
216	putative rubisco subunit binding-protein alpha subunit	246	CTP synthase like protein
217	putative acetone-cyanohydrin lyase	247	putative protein
218	putative isoamylase	248	putative amidase
219	putative protein	249	4-alpha-glucanotransferase
220	HSP associated protein like	250	hypothetical protein
221	60S ribosomal protein L39	251	similar to auxin-induced protein
222	unknown protein	252	putative protein
		253	putative protein
		254	putative protein
		255	hyuC-like protein

TABLE 1 (cont)

256	putative tetracycline transporter protein	287	unknown protein
257	similar to early nodulins	288	putative esterase D
258	putative protein	289	predicted protein of unknown function
259	putative peptidyl-prolyl cis-trans isomerase	290	unknown protein
260	unknown protein	291	putative indole-3-glycerol phosphate synthase
261	unknown protein	292	isopentenyl pyrophosphate:dimethylallyl pyrophosphate isomerase
262	putative endochitinase	293	kinase associated protein phosphatase
263	putative ABC transporter	294	putative K ⁺ channel, beta subunit
264	No function assigned by TIGR	295	KNAT1 homeobox-like protein
265	CONSTANS-like B-box zinc finger protein	296	PSI type II chlorophyll a/b-binding protein, putative
266	unknown protein	297	transcription factor
267	unknown protein	298	putative WD-40 repeat protein, MSI2
268	putative mitochondrial processing peptidase alpha subunit	299	WD-40 repeat protein (MSI3)
269	putative pre-mRNA splicing factor	300	putative WD-40 repeat protein, MSI4
270	putative phosphatidylserine decarboxylase	301	unknown protein
271	unknown protein	302	hypothetical protein
272	unknown protein	303	putative protein
273	unknown protein	304	No function assigned by TIGR
274	putative casein kinase I	305	polyphosphoinositide binding protein, putative
275	unknown protein	306	hypothetical protein
276	60S ribosomal protein	307	unknown protein
L23A		308	chloroplast ribosomal L1 - like protein
277	putative mitochondrial dicarboxylate carrier protein	309	cold-regulated protein cor15b precursor
278	enoyl-ACP reductase (enr-A)	310	cyanohydrin lyase like protein
279	putative isoamylase	311	putative replication protein A1
280	formamidase - like protein	312	putative protein
281	reticuline oxidase - like protein	313	possible apospory-associated like protein
282	unknown protein	314	DNA binding protein GT-1, putative
283	putative transketolase precursor	315	AT-hook DNA-binding protein (AHP1)
284	putative protein	316	putative phospholipase
285	unknown protein	317	chloroplast FtsH protease, putative
286	unknown protein		

TABLE 1 (cont)

318	enoyl-CoA hydratase like protein	348	putative farnesylated protein
319	berberine bridge enzyme - like protein	349	unknown protein
320	putative sugar transporter	350	water stress-induced protein, putative
321	unknown protein	351	unknown protein
322	No function assigned by TIGR	352	unknown protein
323	hypothetical protein	353	PEROXISOMAL MEMBRANE PROTEIN PMP22
324	putative acidic ribosomal protein	354	putative peroxisomal membrane carrier protein
325	putative protein	355	putative protein
326	unknown protein	356	unknown protein
327	hypothetical protein	357	putative protein
328	putative protein	358	putative protein
329		359	argininosuccinate synthase -like protein
	dihydroxypolyprenyl benzoate methyltransferase	360	1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase
330	unknown protein	361	putative JUN kinase activator protein
331	myb-related protein	362	putative 60S ribosomal protein L35
332	No function assigned by TIGR	363	nucleoid DNA-binding protein cnd41 - like protein
333	putative protein	364	SigA binding protein
334	putative disease resistance response protein	365	hypothetical protein
335	hypothetical protein	366	putative protein kinase
336	No function assigned by TIGR	367	unknown protein
337	starch branching enzyme II	368	regulatory protein NPR1-like; transcription factor inhibitor I kappa B-like
338	No function assigned by TIGR	369	putative protein
339	putative enolase (2-phospho-D-glycerate hydroxylase)	370	hypothetical protein
340	putative protein kinase	371	phosphoribosylanthranilate isomerase
341	HD-Zip protein, putative	372	phosphoribosylanthranilate isomerase
342	putative protein kinase	373	sterol glucosyltransferase, putative
343	phenylalanyl-trna synthetase - like protein	374	putative gigantea protein
344	putative aconitase	375	putative MYB family transcription factor
345	NAM(no apical meristem) protein, putative	376	hypothetical protein
346	unknown protein	377	hypothetical protein
347	putative phosphomannomutase	378	predicted protein
		379	cytochrome P450, putative

TABLE 1 (cont)

380	putative Na ⁺ dependent ileal bile acid transporter	416	chloroplast precursor (sp Q02166)
381	unknown protein	417	phytochrome C (sp P14714)
382	RING-H2 finger protein RHF1a	418	putative phytochrome-associated protein 3
383	putative protein	419	receptor serine/threonine kinase PR5K
384	unknown protein	420	Ran-binding protein (atranbp1a)
385	putative protein	421	small Ras-like GTP-binding protein (gb AAB58478.1)
386	putative auxin-regulated protein	422	sterol-C5-desaturase
387	hypothetical protein	423	tryptophan synthase beta chain 1 precursor (sp P14671)
388	unknown protein	424	thioredoxin f2 (gb AAD35004.1)
389	unknown protein	425	No function assigned by TIGR
390	putative protein	426	putative WRKY DNA-binding protein
391	putative protein	427	putative protein
392	unknown protein	428	unknown protein
393	histone H1	429	unknown protein
394	Argonaute (AGO1)-like protein	430	14-3-3 protein homolog RCI1 (pir S47969)
395	unknown protein	431	unknown protein
396	putative protein with C- terminal RING finger	432	putative CCCH-type zinc finger protein
397	unknown protein	433	PINHEAD (gb AAD40098.1); translation initiation factor
398	unknown protein	434	plasma membrane proton ATPase (PMA)
399	unknown protein	435	CHLOROPHYLL A-B BINDING PROTEIN 4 PRECURSOR
400	unknown protein	436	homolog
401	unknown protein	437	membrane related protein CP5, putative
402	putative copper amine oxidase	438	ABC transporter (AtMRP2)
403	unknown protein	439	putative embryo-abundant protein
404	unknown protein	440	putative anthocyanidin-3-glucoside rhamnosyltransferase
405	unknown protein	441	putative lipid transfer protein
406	putative protein	442	unknown protein
407	putative protein	443	unknown protein
408	unknown protein	444	galactinol synthase, putative
409	unknown protein	445	putative protein
410	putative protein	446	putative protein
411	putative protein		SCARECROW-like protein
412	unknown protein		unknown protein
413	serine/threonine kinase - like protein		
414	alcohol dehydrogenase, putative		
415	anthranilate phosphoribosyltransferase,		

TABLE 1 (cont)

447	unknown protein	476	phosphoenolpyruvate carboxylase (PPC)
448	unknown protein	477	chlorophyll a/b-binding protein - like
449	unknown protein	478	AtAGP4
450	asparagine--tRNA ligase	479	putative cryptochrome 2 apoprotein
451	putative protein	480	type 2 peroxiredoxin, putative
452	glutamate-1-semialdehyde 2,1-aminomutase 1 precursor (GSA 1) (glutamate-1-semialdehyde aminotransferase 1) (GSA-AT 1) (sp P42799)	481	Atpm24.1 glutathione S transferase
453	hypothetical protein	482	delta tonoplast integral protein (delta-TIP)
454	putative serine protease-like protein	483	20S proteasome subunit (PAA2)
455	No function assigned by TIGR	484	dormancy-associated protein, putative
456	unknown protein	485	putative cytidine deaminase
457	unknown protein	486	No function assigned by TIGR
458	gamma-adaptin, putative	487	putative phospholipase D-gamma
459	UDP rhamnose--anthocyanidin-3-glucoside rhamnosyltransferase - like protein	488	cell elongation protein, Dwarf1
460	carbonate dehydratase - like protein	489	germin-like protein
461	putative microtubule-associated protein	490	hevein-like protein precursor (PR-4)
462	putative ribophorin I	491	rac-like GTP binding protein (ARAC5)
463	putative zinc finger protein	492	phosphoprotein phosphatase, type 1 catalytic subunit
464	chloroplast FtsH protease, putative	493	ubiquitin-protein ligase UBC9
465	putative protein	494	xyloglucan endotransglycosylase-related protein XTR-7
466	unknown protein	495	cysteine synthase
467	putative LEA protein	496	putative villin 2
468	putative protein	497	glutathione S-transferase
469	putative protein	498	5-adenylylsulfate reductase
470	unknown protein	499	arginine decarboxylase
471	putative purple acid phosphatase	500	ATHP2, putative
472	unknown protein	501	ornithine carbamoyltransferase precursor
473	putative protein	502	putative protein
474	unknown protein	503	putative protein
475	chlorophyll binding protein, putative	504	unknown protein
		505	putative protein
		506	putative protein
		507	unknown protein
		508	unknown protein
		509	unknown protein
		510	unknown protein
		511	hypothetical protein

TABLE 1 (cont)

512	putative protein	552	putative CCCH-type zinc finger protein
513	putative DnaJ protein	553	MAP kinase kinase 2
514	plastocyanin	554	ethylene-insensitive3-like1 (EIL1)
515	unknown protein	555	histidine transport protein (PTR2-B)
516	unknown protein	556	putative auxin-induced protein AUX2-11
517	unknown protein	557	hydroxyacylglutathione hydrolase cytoplasmic (glyoxalase II) (GLX II)
518	unknown protein	558	delta-8 sphingolipid desaturase
519	unknown protein	559	cellulose synthase catalytic subunit (Ath-A)
520	unknown protein	560	nitrate transporter (NTL1)
521	putative ATP-dependent RNA helicase	561	DNA-binding homeotic protein Athb-2
522	non-race specific disease resistance protein (NDR1)	562	hypothetical protein
523	hypothetical protein	563	aspartate aminotransferase
524	putative protein	564	4-coumarate:CoA ligase 1
525	putative protein	565	pyruvate dehydrogenase E1 beta subunit, putative
526	putative protein	566	nucleotide diphosphate kinase Ia (emb CAB58230.1)
527	copper transport protein	567	chloroplast Cpn21 protein
528	putative protein	568	ATP dependent copper transporter
529	unknown protein	569	very-long-chain fatty acid condensing enzyme (CUT1)
530	unknown protein	570	putative purine-rich single-stranded DNA-binding protein
531	unknown protein	571	serine/threonine protein phosphatase (type 2A)
532	putative protein kinase	572	isopentenyl diphosphate:dimethylallyl diphosphate isomerase (IPP2)
533	unknown protein	573	putative c2h2 zinc finger transcription factor
534	putative protein	574	putative 20S proteasome beta subunit PBC2
535	putative protein	575	nucleoside diphosphate kinase 3 (ndpk3)
536	hypothetical protein	576	ras-related small GTP-binding protein
537	putative protein	577	putative 4-coumarate:CoA ligase 2
538	putative AP2 domain transcription factor		
539	putative nitrilase		
540	putative protein		
541	putative tetrahydrofolate synthase		
542	heat-shock protein		
543	unkown protein		
544	unknown protein		
545	histone H4		
546	hypothetical protein		
547	unknown protein		
548	putative protein		
549	predicted protein		
550	putative dihydrolipoamide succinyltransferase		
551	actin 3		

TABLE 1 (cont)

578	transcription factor HBP-1b homolog (sp P43273)	609	photosystem II oxygen-evolving complex protein 3 - like
579	biotin synthase (Bio B)	610	sedoheptulose-bisphosphatase precursor
580	homeobox protein HAT22	611	glutathione S-transferase (GST6)
581	putative preprotein translocase SECY protein	612	geranylgeranyl reductase
582	carbamoylphosphate synthetase, putative	613	hypothetical protein
583	putative protein kinase, ADK1	614	hypothetical protein
584	putative nuclear DNA-binding protein G2p	615	phosphoribulokinase precursor
585	hypothetical protein	616	high mobility group protein (HMG1), putative
586	hypothetical protein	617	protease inhibitor II
587	unknown protein	618	protease inhibitor II
588	unknown protein	619	cytochrome P450 90A1 (sp Q42569)
589	molybdopterin synthase (CNX2)	620	unknown protein
590	putative ribosomal protein L6	621	heat shock protein 90
591	unknown protein	622	tubulin beta-9 chain
592	En/Spm-like transposon protein	623	putative ubiquitin carboxyl terminal hydrolase
593	putative protein	624	protein kinase
594	putative protein	625	DRE/CRT-binding protein DREB1C
595	unknown protein	626	histidyl-tRNA synthetase
596	hypothetical protein	627	splicing factor, putative
597	unknown protein	628	glutamyl-tRNA synthetase
598	unknown protein	629	putative RING zinc finger protein
599	putative lysosomal acid lipase	630	phytochelatin synthase (gb AAD41794.1)
600	unknown protein	631	putative C2H2-type zinc finger protein
601	unknown protein	632	putative ligand-gated ion channel protein
602	NifS-like aminotransferase	633	putative ribosomal-protein S6 kinase (ATPK6)
603	actin 8	634	MOLYBDOPTERIN BIOSYNTHESIS CNX1 PROTEIN
604	hypothetical protein	635	temperature-sensitive omega-3 fatty acid desaturase, chloroplast precursor (sp P48622)
605	putative protein	636	adenylosuccinate synthetase
606	heat-shock protein (At-hsc70-3)	637	putative 14-3-3 protein
607	putative protein disulfide isomerase precursor	638	putative cytochrome P450
608	adenosine nucleotide translocator		

TABLE 1 (cont)

639	putative two-component response regulator 3 protein	667	putative receptor-like protein kinase
640	putative RING-H2 zinc finger protein ATL6	668	putative disease resistance protein
641	No function assigned by TIGR	669	receptor-like protein kinase - like
642	small zinc finger-like protein	670	ubiquitin activating enzyme 2 (gb AAB37569.1)
643	hypothetical protein	671	No function assigned by TIGR
644	MAP kinase (ATMPK6)	672	putative receptor-like protein kinase
645	vacuolar ATP synthase, putative	673	K ⁺ transporter, AKT1
646	kinesin-like protein	674	shaggy-like kinase beta
647	serine/threonine-specific protein kinase NAK	675	heat shock protein 70
648	No function assigned by TIGR	676	plasma membrane intrinsic protein 1a
649	ACTIN 2/7 (sp P53492)	677	HSP90-like protein
650	phosphoglycerate kinase, putative	678	histone H1, putative
651	homeotic protein BEL1 homolog	679	unknown protein
652	proline iminopeptidase	680	dnaK-type molecular chaperone hsc70.1 - like
653	pasticcino 1	681	gamma-glutamylcysteine synthetase
654	serine/threonine protein kinase	682	peroxidase (ATP22a)
655	cytochrome P450 monooxygenase (CYP71B4)	683	putative serine carboxypeptidase precursor
656	No function assigned by TIGR	684	putative dioxygenase
657	putative GDSL-motif lipase/hydrolase	685	glucose transporter
658	putative protein	686	NOI protein, nitrate-induced
659	unknown protein	687	putative protein
660	hypothetical protein	688	putative protein
661	putative glycosylation enzyme	689	unknown protein
662	No function assigned by TIGR	690	putative photosystem I reaction center subunit II precursor
663	No function assigned by TIGR	691	putative protein
664	unknown protein	692	unknown protein
665	putative ABC transporter	693	cobalamin biosynthesis protein
666	nifU-like protein	694	adenine nucleotide translocase
		695	glutathione transferase, putative
		696	putative 60S ribosomal protein L21
		697	cytochrome P450 like protein
		698	cytochrome b245 beta chain homolog RbohAp108, putative
		699	RNA helicase, DRH1
		700	putative aldolase
		701	farnesyltransferase subunit A (FTA)

TABLE 1 (cont)

702	No function assigned by TIGR	725	putative protein
703	putative putative sister-chromatide cohesion protein	726	NBD-like protein (gb AAD20643.1)
704	calcium-dependent protein kinase	727	AtHVA22c
705	serine/threonine protein phosphatase type 2A, putative	728	unknown protein
706	40S ribosomal protein S28 (sp P34789)	729	phytoene synthase (gb AAB65697.1)
707	RNA polymerase subunit	730	protein kinase (AME2/AFC1)
708	DNA-damage-repair/tolerant protein DRT102	731	hypothetical protein
709	putative C2H2-type zinc finger protein	732	cyclin-dependent protein kinase-like protein
710	putative adenosine phosphosulfate kinase	733	photosystem II stability/assembly factor HCF136 (sp O82660)
711	lipase	734	hypothetical protein
712	putative violaxanthin de-epoxidase precursor (U44133)	735	DNA binding-like protein
713	aromatic rich glycoprotein, putative	736	putative protein
714	putative fumarase	737	chorismate mutase
715	flavonol synthase (FLS) (sp Q96330)	738	putative LRR receptor protein kinase
716	response regulator 5, putative	739	putative chalcone synthase
717	sulfate transporter	740	putative protein kinase
718	putative floral homeotic protein, AGL9	741	replicase, putative
719	putative ethylene-inducible protein	742	putative cysteine proteinase
720	C-8,7 sterol isomerase	743	60S ribosomal protein L36
721	TCH4 protein (gb AAA92363.1)	744	unknown protein
722	hypothetical protein	745	CLC-b chloride channel protein
723	putative urease accessory protein	746	putative ribosomal protein S14
724	molybdopterin synthase sulphurylase (gb AAD18050.1)	747	histone H2B like protein (emb CAA69025.1)
		748	60S ribosomal protein L2
		749	60S ribosomal protein L15 homolog
		750	ribosomal protein S27
		751	ribosomal protein
		752	60S ribosomal protein L12
		753	60s ribosomal protein L34
		754	putative ribosomal protein S10
		755	drought-induced protein like
		756	blue copper-binding protein, 15K (lamin)
		757	calmodulin-like protein
		758	putative protein
		759	No function assigned by TIGR
		760	alpha-mannosidase, putative
		761	uncoupling protein (ucp/PUMP)

TABLE 1 (cont)

762	homeodomain - like protein	786	calcium-dependent protein kinase (pir S71196)
763	ribosomal protein S18, putative	787	phosphoinositide specific phospholipase C
764	similar to SOR1 from the fungus <i>Cercospora</i> <i>nicotianae</i>	788	similarity to S-domain receptor- like protein kinase, <i>Zea mays</i>
765	60S ribosomal protein L13, BBC1 protein	789	mitosis-specific cyclin 1b
766	50S ribosomal protein L24, chloroplast precursor	790	4-coumarate:CoA ligase 3
767	putative ribosomal protein	791	transcription factor IIB (TFIIB)
768	unknown protein	792	unknown protein
769	aspartate aminotransferase (AAT1)	793	hypothetical protein
770	potassium channel protein AtKC	794	hypothetical protein
771	unknown protein	795	sugar transporter like protein
772	peroxisomal targeting signal type 2 receptor	796	putative trypsin inhibitor
773	putative protein	797	unknown protein
774	Ras-related GTP-binding protein (ARA-4)	798	putative multispanning membrane protein
775	S-receptor kinase homolog 2 precursor	799	receptor-like kinase, putative
776	pathogenesis-related group 5 protein, putative	800	putative inosine-5-monophosphate dehydrogenase
777	Nitrilase 4 (sp P46011)	801	inosine-5'-monophosphate dehydrogenase, putative
778	biotin carboxyl carrier protein of acetyl-CoA carboxylase precursor (BCCP) (sp Q42533)	802	amino acid permease 6 (emb CAA65051.1)
779	photosystem I reaction centre subunit psaN precursor (PSI-N) (sp P49107)	803	NADPH-ferrihemoprotein reductase (ATR2)
780	3(2),5-bisphosphate nucleotidase	804	putative WRKY-type DNA binding protein
781	high affinity Ca ²⁺ antiporter	805	putative ankyrin
782	putative cytoskeletal protein	806	putative hexose transporter
783	putative peroxidase	807	aquaporin/MIP - like protein
784	respiratory burst oxidase protein	808	Ser/Thr protein kinase isolog
785	beta-glucosidase	809	pectate lyase like protein
		810	putative 60S ribosomal protein L17
		811	putative protein
		812	unknown protein
		813	phenylalanine ammonia-lyase
		814	putative cytochrome P450 monooxygenase
		815	ARR1 protein, putative
		816	putative bHLH transcription factor
		817	aminomethyltransferase-like precursor protein
		818	purple acid phosphatase precursor

TABLE 1 (cont)

819	AP2 domain containing protein, putative	844	mercaptopyruvate sulfurtransferase, putative
820	ubiquitin-conjugating enzyme E2-21 kD 1 (ubiquitin-protein ligase 4) (ubiquitin carrier protein 4) (sp P42748)	845	putative thiosulfate sulfurtransferase
821	translation initiation factor	846	dihydrolipoamide S-acetyltransferase
822	putative VAMP-associated protein	847	auxin transport protein REH1, putative
823	spermidine synthase, putative	848	putative auxin transport protein
824	putative protein	849	apyrase (Atapy1)
825	unknown protein	850	root cap 1 (RCP1)
826	AtKAP alpha	851	hypothetical protein
827	glyceraldehyde-3-phosphate dehydrogenase, putative	852	putative protein
828	putative poly(A) binding protein	853	predicted protein of unknown function
829	alpha-tubulin, putative	854	hypothetical protein
830	serine/threonine-specific protein kinase ATPK64 (pir S20918)	855	hypothetical protein
831	putative aspartate-tRNA ligase	856	hypothetical protein
832	ras-related small GTP-binding protein RAB1c	857	putative aldehyde dehydrogenase
833	cycloartenol synthase	858	putative peroxidase
834	No function assigned by TIGR	859	UDP-glucose 4-epimerase - like protein
835	cytochrome P450	860	indole-3-acetate beta-glucosyltransferase like protein
836	GTPase AtRAB8	861	putative beta-1,3-glucanase
837	3-phosphoserine phosphatase	862	disease resistance protein-like
838	transcription factor CRC	863	putative respiratory burst oxidase protein B
839	nuclear cap-binding protein; CBP20 (gb AAD29697.1)	864	ubiquitin-conjugating enzyme UBC3
840	chloroplast membrane protein (ALBINO3)	865	cytoplasmic aconitate hydratase
841	biotin holocarboxylase synthetase	866	NADPH oxidoreductase, putative
842	expansin AtEx6	867	PROTEIN TRANSPORT PROTEIN SEC61 GAMMA SUBUNIT -like
843	unknown protein	868	putative protein
		869	unknown protein
		870	60S acidic ribosomal protein P2
		871	No function assigned by TIGR
		872	1,4-alpha-glucan branching enzyme protein soform SBE2.2 precursor
		873	calcium binding protein (CaBP-22)
		874	putative phosphoglucomutase

TABLE 1 (cont)

875	shaggy-like protein kinase etha (EC 2.7.1.-)	901	putative RAS superfamily GTP-binding protein
876	pyruvate decarboxylase (gb AAB16855.1)	902	disease resistance protein-like
877	hypothetical protein	903	protein kinase like protein
878	putative protein kinase	904	glucuronosyl transferase-like protein
879	putative protein kinase	905	putative homeodomain transcription factor
880	putative leucine aminopeptidase	906	putative flavonol reductase
881	probable cytochrome P450	907	putative protein
882	protein kinase 6-like protein	908	salt-tolerance protein
883	arginine methyltransferase (pam1)	909	40S ribosomal protein S30
884	MYB96 transcription factor-like protein	910	putative bZIP transcription factor
885	putative protein	911	putative protein
886	metal ion transporter	912	putative cinnamoyl CoA reductase
887	No function assigned by TIGR	913	unknown protein
888	flax rust resistance protein, putative	914	putative RNA-binding protein
889	fructose-2,6-bisphosphatase, putative	915	phosphatidylinositol synthase (PIS1)
890	exonuclease RRP41	916	unknown protein
891	squamosa promoter binding protein-like 2 (emb CAB56576.1)	917	hydroxyproline-rich glycoprotein homolog
892	putative squamosa-promoter binding protein	918	50S ribosomal protein L15, chloroplast precursor
893	O-acetylserine(thiol) lyase, putative	919	unknown protein
894	snoRNA	920	putative YME1 ATP-dependant protease
895	snoRNA	921	unknown protein
896	ferredoxin-NADP+ reductase	922	putative ribosomal protein L28
897	H+-transporting ATP synthase chain 9 - like protein	923	unknown protein
898	photosystem I subunit III precursor, putative	924	putative protein
899	photosystem I subunit VI precursor	925	protein ch-42 precursor, chloroplast
900	auxin-binding protein 1 precursor	926	protein serine/threonine kinase, putative
		927	beta-VPE
		928	putative vacuolar sorting receptor
		929	putative translation initiation factor IF-2
		930	predicted protein of unknown function
		931	putative protein
		932	hypothetical protein
		933	hypothetical protein
		934	phosphate transporter, putative

TABLE 1 (cont)

935	No function assigned by TIGR	961	unknown protein
936	beta subunit of protein farnesyl transferase ERA1	962	unknown protein
937	putative glutamate decarboxylase	963	unknown protein
938	putative indole-3-acetate beta-glucosyltransferase	964	myrosinase-associated protein, putative
939	putative receptor-like protein kinase	965	hypothetical protein
940	UDP-galactose 4-epimerase-like protein	966	hypothetical protein
941	putative proliferating cell nuclear antigen, PCNA	967	No function assigned by TIGR
942	ubiquitin conjugating enzyme E2 (UBC13)	968	unknown protein
943	cyclophilin (CYP2)	969	hypothetical protein
944	cystatin (emb CAA03929.1)	970	LAX1 / AUX1 -like permease
945	putative alcohol dehydrogenase	971	putative UDP-N-acetylglucosamine--dolichyl-phosphate N-acetylglucosaminephosphotransferase
946	acidic ribosomal protein p1	972	chorismate mutase CM2
947	glutathione transferase AtGST 10 (emb CAA10457.1)	973	inner mitochondrial membrane protein
948	putative tropinone reductase	974	DEF (CLA1) protein
949	ZIP4, a putative zinc transporter	975	decoy
950	unknown protein	976	citrate synthase
951	putative protein	977	myosin
952	putative protein	978	40S ribosomal protein S19
953	putative C2H2-type zinc finger protein	979	ripening-related protein - like
954	putative RING zinc finger protein	980	putative signal peptidase I
955	putative microtubule-associated protein	981	methionyl-tRNA synthetase (AtcpMetRS)
956	unknown protein	982	ribosomal protein precursor - like
957	putative protein	983	50S ribosomal protein L21 chloroplast precursor (CL21)
958	putative protein phosphatase-2c	984	putative MYB family transcription factor
959	V-ATPase subunit G (vag2 gene)	985	cyclophilin - like protein
960	hypothetical protein	986	hypothetical protein
		987	naringenin 3-dioxygenase like protein
		988	WD-repeat protein -like protein
		989	putative serine carboxypeptidase II
		990	prenyltransferase, putative
		991	putative ligand-gated ion channel protein
		992	clathrin adaptor medium chain protein MU1B, putative
		993	No function assigned by TIGR

TABLE 1 (cont)

994	putative Tal1-like non-LTR retroelement protein	1025	putative tropinone reductase
995	putative 3-isopropylmalate dehydrogenase	1026	signal response protein (GAI)
996	3-isopropylmalate dehydratase, small subunit	1027	putative steroid sulfotransferase
997	unknown protein	1028	hypothetical protein
998	unknown protein	1029	nucleic acid binding protein - like
999	unknown protein	1030	putative protein
1000	hypothetical protein	1031	blue copper binding protein
1001	putative protein	1032	farnesylated protein (ATFP6)
1002	No function assigned by TIGR	1033	unknown protein
1003	putative beta-glucosidase	1034	putative PCF2-like DNA binding protein
1004	putative pectate lyase A11	1035	teosinte branched1 - like protein
1005	putative beta-glucosidase	1036	putative protein
1006	HD-Zip protein	1037	unknown protein
1007	putative ubiquitin conjugating enzyme	1038	unknown protein
1008	homeobox-leucine zipper protein-like	1039	2-oxoglutarate dehydrogenase, E1 component
1009	cytochrome P450 like protein	1040	unknown protein
1010	putative cysteine proteinase inhibitor B (cystatin B)	1041	unknown protein
1011	ethylene response sensor (ERS)	1042	CCAAT-binding transcription factor subunit A(CBF-A)
1012	putative SWH1 protein	1043	hypothetical protein
1013	putative glutathione S-transferase	1044	putative growth regulator protein
1014	putative protein	1045	putative presenilin
1015	unknown protein	1046	putative expansin
1016	putative protein phosphatase 2C	1047	ribosomal - like protein
1017	dnaJ protein homolog atj3	1048	unknown protein
1018	ferredoxin	1049	unknown protein
1019	hypothetical protein	1050	putative protein
1020	putative sugar transport protein, ERD6	1051	putative protein
1021	putative DnaJ protein	1052	unknown protein
1022	putative AP2 domain transcription factor	1053	unknown protein
1023	putative protein	1054	unknown protein
1024	putative cyclin-dependent kinase regulatory subunit	1055	unknown protein
		1056	unknown protein
		1057	putative protein
		1058	putative protein
		1059	argininosuccinate lyase (AtArgH)
		1060	disease resistance protein homolog
		1061	aldehyde dehydrogenase like protein
		1062	GBF2, G-box binding factor
		1063	CDPK-related kinase
		1064	endo-1,4-beta-glucanase
		1065	putative serine protease

TABLE 1 (cont)

1066	serine/threonine-specific kinase lecRK1 precursor, lectin receptor-like	1091	putative ATP-dependent RNA helicase
1067	putative MAP kinase	1092	putative protein
1068	RNase L inhibitor-like protein	1093	putative HMG protein
1069	No function assigned by TIGR	1094	squalene monooxygenase 2 (squalene epoxidase 2) (SE 2) (sp O65403)
1070	AP2 domain transcription factor	1095	eukaryotic peptide chain release factor subunit 1, putative
1071	polygalacturonase isoenzyme 1 beta subunit, putative	1096	auxin-induced protein - like
1072	putative lipid transfer protein	1097	putative lipoamide dehydrogenase
1073	putative protein kinase	1098	putative protein
1074	putative protein	1099	unknown protein
1075	ATP-dependent RNA helicase like protein	1100	putative oligopeptide transporter
1076	putative cyclic nucleotide-regulated ion channel protein	1101	putative translation elongation factor ts
1077	COP1 like protein	1102	putative CCAAT-binding transcription factor subunit
1078	putative peroxidase	1103	putative ABC transporter
1079	putative NAK-like ser/thr protein kinase	1104	putative superoxide-generating NADPH oxidase flavocytochrome
1080	putative cytochrome C	1105	aspartate kinase-homoserine dehydrogenase - like protein
1081	cytochrome c	1106	putative bHLH transcription factor
1082	putative serine carboxypeptidase II	1107	putative geranylgeranyl transferase type I beta subunit
1083	acyl-(acyl carrier protein) thioesterase	1108	putative ARP2/3 protein complex subunit p41
1084	DNA-binding factor, putative	1109	sulphite reductase
1085	MAP3K delta-1 protein kinase	1110	putative auxin-regulated protein
1086	AtMlo-h1-like protein	1111	transcription factor scarecrow-like 14, putative
1087	No function assigned by TIGR	1112	unknown protein
1088	putative expansin	1113	monooxygenase 2 (MO2)
1089	defender against cell death protein, putative	1114	putative amine oxidase
1090	glycolate oxidase - like protein	1115	zinc finger protein, putative
		1116	DNA-binding protein, putative
		1117	putative protein
		1118	putative protein
		1119	Avr9 elicitor response like protein
		1120	putative protein
		1121	hypothetical protein
		1122	putative nucleotide-sugar dehydratase
		1123	UFD1 like protein

TABLE 1 (cont)

1124	putative trans-prenyltransferase	1155	cytochrome c oxidoreductase like protein
1125	outward rectifying potassium channel KCO	1156	putative carboxymethylenebutenolidase
1126	unknown protein	1157	unknown protein
1127	putative pectinacetyltransferase	1158	unknown protein
1128	putative protein	1159	unknown protein
1129	No function assigned by TIGR	1160	unknown protein
1130	unknown protein	1161	unknown protein
1131	unknown protein	1162	unknown protein
1132	unknown protein	1163	auxin-induced protein (IAA20)
1133	protein phosphatase homolog (PPH1)	1164	50S ribosomal protein L4
1134	unknown protein	1165	putative DNA topoisomerase III beta
1135	No function assigned by TIGR	1166	No function assigned by TIGR
1136	unknown protein	1167	isp4 like protein
1137	unknown protein	1168	putative protein kinase
1138	unknown protein	1169	hypothetical protein
1139	putative protein	1170	putative pyrophosphate--fructose-6-phosphate 1-phosphotransferase
1140	unknown protein	1171	putative protein
1141	putative ubiquinol--cytochrome-c reductase	1172	putative protein
1142	unknown protein	1173	putative protein
1143	contains similarity to high-glucose-regulated protein 8 GB:AAF08813 GI:6449083 from [Homo sapiens]	1174	unknown protein
1144	unknown protein	1175	unknown protein
1145	putative cis-Golgi SNARE protein	1176	putative protein
1146	unknown protein	1177	putative protein
1147	glutamate-1-semialdehyde aminotransferase	1178	unknown protein
1148	No function assigned by TIGR	1179	unknown protein
1149	hypothetical protein	1180	putative protein
1150	unknown protein	1181	brassinosteroid insensitive 1 gene (BRI1)
1151	unknown protein	1182	putative receptor protein kinase
1152	unknown protein	1183	vacuolar-type H ⁺ -translocating inorganic pyrophosphatase
1153	scarecrow-like 3	1184	protein kinase - like protein
1154	putative proline-rich protein	1185	glycyl tRNA synthetase, putative
		1186	subtilisin proteinase - like
		1187	hypothetical protein
		1188	cytochrome P450-like protein
		1189	cytochrome p450 like protein
		1190	putative protein kinase
		1191	pectinesterase - like protein
		1192	putative receptor-like protein kinase

TABLE 1 (cont)

1193	peroxidase ATP17a -like protein	1219	putative AP2 domain transcription factor
1194	No function assigned by TIGR	1220	brassinosteroid receptor kinase, putative
1195	cellulose synthase catalytic subunit - like protein	1221	TINY-like protein
1196	RAS-related protein, RAB7	1222	glucose-6-phosphate isomerase
1197	putative aspartate aminotransferase	1223	putative protein
1198	cyclophilin	1224	putative NAM (no apical meristem)-like protein
1199	putative SF2/ASF splicing modulator, Srp30	1225	unknown protein
1200	putative cytochrome b5	1226	putative nucleotide-binding protein
1201	glutamyl-tRNA reductase, putative	1227	bZIP transcription factor (POSF21)
1202	putative MADS-box protein	1228	ubiquitin activating enzyme - like protein
1203	ammonium transport protein (AMT1)	1229	telomere repeat-binding protein
1204	No function assigned by TIGR	1230	unknown protein
1205	putative beta-ketoacyl-CoA synthase	1231	mevalonate kinase
1206	thaumatin-like protein	1232	putative protein
1207	putative methionine aminopeptidase	1233	hypothetical protein
1208	putative protein phosphatase 2C	1234	disease resistance RPP5 like protein
1209	kinase-like protein	1235	putative protein
1210	receptor-associated kinase isolog	1236	putative pectinesterase
1211	mitochondrial ribosomal protein S14	1237	Ttg1 protein (emb CAB45372.1)
1212	oleosin, 18.5K	1238	FUSCA PROTEIN FUS6
1213	chalcone isomerase	1239	NHE1 Na ⁺ /H ⁺ exchanger
1214	putative cyclin-dependent kinase regulatory subunit	1240	No function assigned by TIGR
1215	putative thaumatin-like protein	1241	Phospholipase like protein
1216	putative two-component response regulator protein	1242	unknown protein
1217	TATA binding protein-associated factor, putative	1243	unknown protein
1218	predicted protein of unknown function	1244	unknown protein
		1245	AUX1-like amino acid permease
		1246	unknown protein
		1247	putative C2H2-type zinc finger protein
		1248	putative protein
		1249	putative protein
		1250	putative glucosyltransferase
		1251	putative lipase
		1252	putative protein
		1253	putative thioredoxin
		1254	AIG2-like protein
		1255	short-chain alcohol dehydrogenase like protein
		1256	hypothetical protein

TABLE 1 (cont)

1257	putative protein	1287	No function assigned by TIGR
1258	putative protein	1288	serine/threonine protein kinase ATPK10
1259	glutathione peroxidase - like protein	1289	putative lipase
1260	putative protein	1290	choline kinase GmCK2p -like protein
1261	putative disease resistance response protein	1291	putative sugar transport protein, ERD6
1262	putative protein	1292	MYB27 protein - like
1263	senescence-associated protein (SAG29)	1293	DNA-binding protein, putative
1264	glycolate oxidase, putative	1294	similar to cold acclimation protein WCOR413 [<i>Triticum aestivum</i>]
1265	extensin - like protein	1295	unknown protein
1266	putative protein	1296	aquaporin (plasma membrane intrinsic protein 2B)
1267	unknown protein	1297	No function assigned by TIGR
1268	putative disease resistance protein	1298	P-Protein - like protein
1269	putative receptor-like protein kinase	1299	No function assigned by TIGR
1270	putative receptor-like protein kinase	1300	putative cytochrome P450 monooxygenase
1271	basic chitinase	1301	putative cytochrome P450 monooxygenase
1272	putative pectin methylesterase	1302	putative thioredoxin
1273	peroxidase ATP N	1303	stromal ascorbate peroxidase
1274	class 2 non-symbiotic hemoglobin	1304	ethylene responsive element binding factor-like protein (AtERF6)
1275	nitrate transporter	1305	auxin transport protein EIR1 (gb AAC39513.1)
1276	Ca ²⁺ /H ⁺ -exchanging protein-like	1306	putative CONSTANS-like B-box zinc finger protein
1277	putative protein	1307	putative protein kinase
1278	hydroxynitrile lyase like protein	1308	mitochondrial Lon protease homolog 1 precursor (sp O64948)
1279	putative AP2 domain transcription factor	1309	putative protein
1280	pectin methylesterase, putative	1310	heme activated protein, putative
1281	putative protein	1311	putative cytochrome P450
1282	beta-glucosidase-like protein	1312	No function assigned by TIGR
1283	CCAAT box binding factor/transcription factor Hap2a	1313	putative lipase
1284	putative fibrillin	1314	putative protein
1285	xyloglucan endo-transglycosylase	1315	putative sugar transporter protein
1286	putative 10kd chaperonin	1316	putative sucrose transport protein, SUC2
		1317	putative protein
		1318	putative protein

TABLE 1 (cont)

1319	putative endochitinase	1351	unknown protein
1320	putative acetone-cyanohydrin lyase	1352	bZIP transcription factor - like protein
1321	putative protein	1353	Medicago nodulin N21-like protein
1322	calmodulin-like protein	1354	putative endo-1,4-beta glucanase
1323	hypothetical protein	1355	1-aminocyclopropane-1-carboxylate oxidase
1324	cysteine proteinase like protein	1356	putative anion exchange protein
1325	heat shock protein 17.6-II	1357	SRG1-like protein
1326	heat shock protein 18	1358	putative protein
1327	Arabidopsis mitochondrion-localized small heat shock protein (AtHSP23.6-mito)	1359	putative phi-1-like phosphate-induced protein
1328	unknown protein	1360	putative protein
1329	putative WRKY-type DNA binding protein	1361	putative embryo-abundant protein
1330	No function assigned by TIGR	1362	putative hydrolase
1331	hypothetical protein	1363	unknown protein
1332	putative integral membrane protein nodulin	1364	unknown protein
1333	putative protein	1365	hexose transporter - like protein
1334	unknown protein	1366	unknown protein
1335	3-isopropylmalate dehydratase, small subunit	1367	unknown protein
1336	unknown protein	1368	peptide transport - like protein
1337	putative homeodomain transcription factor	1369	unknown protein
1338	unknown protein	1370	putative peptide transporter
1339	putative protein	1371	disease resistance protein, putative
1340	peroxidase ATP19a	1372	cysteine protease component of protease-inhibitor complex
1341	putative Na ⁺ /H ⁺ -exchanging protein	1373	putative cytochrome P450
1342	putative auxin-regulated protein	1374	putative protein
1343	unknown protein	1375	hypothetical protein
1344	unknown protein	1376	unknown protein
1345	putative trehalose-6-phosphate synthase	1377	putative phosphoribosylaminoimidazolecarboxamide formyltransferase
1346	putative lectin	1378	putative protein
1347	Mlo protein-like	1379	HSP like protein
1348	unknown protein	1380	unknown protein
1349	ethylene response factor, putative	1381	unknown protein
1350	unknown protein	1382	putative cytochrome P450
		1383	similar to pectinesterase
		1384	putative glucosyltransferase
		1385	thaumatin-like protein
		1386	drought-inducible cysteine proteinase RD19A precursor
		1387	vegetative storage protein Vsp2
		1388	unknown protein

TABLE 1 (cont)

1389	unknown protein	1417	G-box binding bZIP transcription factor
1390	anthranilate N-benzoyltransferase - like protein	1418	putative protein
1391	delta-1-pyrroline 5-carboxylase synthetase (P5C1)	1419	putative protein
1392	glutathione S-conjugate transporting ATPase (AtMRP1)	1420	putative protein
1393	hypothetical protein	1421	ATFP4-like
1394	hypothetical protein	1422	unknown protein
1395	unknown protein	1423	unknown protein
1396	putative protein	1424	putative protein
1397	putative protein	1425	invertase inhibitor homolog (emb CAA73335.1)
1398	No function assigned by TIGR	1426	unknown protein
1399	unknown protein	1427	unknown protein
1400	putative protein kinase	1428	putative cytochrome b5
1401	unknown protein	1429	putative protein
1402	hypothetical protein	1430	putative protein
1403	unknown protein	1431	putative protein
1404	putative calcium-binding EF-hand protein	1432	No function assigned by TIGR
1405	cinnamyl-alcohol dehydrogenase ELI3-1	1433	putative copper/zinc superoxide dismutase
1406	putative protein	1434	protein phosphatase ABI1
1407	unknown protein	1435	glutamate dehydrogenase 2
1408	senescence-associated protein sen1	1436	No function assigned by TIGR
1409	hypothetical protein	1437	low-temperature-induced protein 78 (sp Q06738)
1410	putative cytochrome P450	1438	putative myo-inositol 1-phosphate synthase
1411	proline oxidase, mitochondrial precursor (osmotic stress-induced proline dehydrogenase)	1439	phosphate transporter (gb AAB17265.1)
1412	putative response regulator 3	1440	4-hydroxyphenylpyruvate dioxygenase (HPD)
1413	hypothetical protein	1441	histone H1
1414	glutamine-dependent asparagine synthetase	1442	hypothetical protein
1415	lysine-ketoglutarate reductase/saccharopine	1443	No function assigned by TIGR
1416	En/Spm-like transposon protein	1444	neoxanthin cleavage enzyme-like protein
		1445	dehydration-induced protein RD22
		1446	zinc finger protein ZAT7
		1447	unknown protein
		1448	unknown protein
		1449	unknown protein
		1450	unknown protein
		1451	putative protein
		1452	putative protein
		1453	RNA helicase, putative

TABLE 1 (cont)

1454	putative glycine-rich protein	1483	unknown protein
1455	hypothetical protein	1484	cold and ABA inducible protein kin1
1456	putative protein	1485	gamma-VPE (vacuolar processing enzyme)
1457	peroxidase	1486	putative protein 1 photosystem II oxygen-evolving complex
1458	peroxidase ATP3a (emb CAA67340.1)	1487	myrosinase-associated protein, putative
1459	metallothionein-like protein	1488	transcription factor ATMYB4
1460	endomembrane-associated protein	1489	H-protein promoter binding factor-2a
1461	ferritin 1 precursor	1490	ammonium transporter, putative
1462	dehydrin RAB18-like protein (sp P30185)	1491	putative zeta-carotene desaturase precursor
1463	HSR201 like protein	1492	high-affinity nitrate transporter NRT2
1464	light regulated protein, putative	1493	light induced protein like
1465	Dr4(protease inhibitor)	1494	putative AT-hook DNA-binding protein
1466	mitogen activated protein kinase kinase (nMAPKK)	1495	putative glycogenin
1467	glutathione S-transferase	1496	putative light repressible receptor protein kinase
1468	transcriptional activator CBF1/ CRT/CRE binding factor 1	1497	serine/threonine kinase - like protein
1469	homeobox-leucine zipper protein ATHB-12	1498	putative peroxidase
1470	amino acid permease I	1499	cytochrome P450 monooxygenase (CYP83A1)
1471	MAP kinase (ATMPK7)	1500	MYB-related transcription factor (CCA1)
1472	potassium channel protein AKT3	1501	Terminal flower1 (TFL1)
1473	cytochrome P450 monooxygenase (CYP91A2)	1502	sulfate transporter ATST1
1474	putative transport protein	1503	RING-H2 finger protein RHA3b
1475	putative protein	1504	lipoxygenase, putative
1476	hypothetical protein	1505	serine O-acetyltransferase (EC 2.3.1.30) Sat-52 (pir S71207)
1477	putative protein	1506	ferulate-5-hydroxylase (FAH1)
1478	hypothetical protein	1507	En/Spm-like transposon protein, putative
1479	receptor protein kinase-like protein	1508	calmodulin-binding - like protein
1480	serine/threonine protein kinase - like protein	1509	hypothetical protein
1481	putative auxin-regulated protein	1510	somatic embryogenesis receptor-like kinase -like protein
1482	amino acid transport protein AAP2	1511	putative giberellin beta-hydroxylase

TABLE 1 (cont)

1512	putative pectinesterase	1542	60S acidic ribosomal protein P0
1513	putative protein	1543	putative protein
1514	unknown protein	1544	auxin-induced protein, putative
1515	ribosomal protein	1545	unknown protein
1516	low-temperature-induced 65 kD protein (sp Q04980)	1546	hypothetical protein
1517	putative glucosyltransferase	1547	protein phosphatase 2C ABI2 (PP2C) (sp O04719)
1518	peroxidase (emb CAA67551.1)	1548	peroxidase, prxr2
1519	ankyrin-like protein	1549	putative peroxidase ATP12a
1520	ribosomal protein S11 - like	1550	putative beta-amylase
1521	hypothetical protein	1551	putative acetone-cyanohydrin lyase
1522	glycoprotein(EP1), putative	1552	fatty acid elongase 3-ketoacyl-CoA synthase 1
1523	calnexin - like protein	1553	putative citrate synthase
1524	SRG1-like protein	1554	pEARLI 1-like protein
1525	ethylene response factor 1 (ERF1)	1555	putative MYB family transcription factor
1526	transcriptional activator CBF1-like protein	1556	putative transcription factor MYB28
1527	xyloglucan endo-1,4-beta- D-glucanase (XTR-6)	1557	RNA helicase-like protein
1528	putative cinnamyl alcohol dehydrogenase	1558	snoRNA
1529	gibberellin 3 beta- hydroxylase, putative	1559	putative protein kinase
1530	auxin response transcription factor 3 (ETTIN/ARF3)	1560	growth regulator like protein
1531	No function assigned by TIGR	1561	putative potassium transporter
1532	putative protein	1562	putative protein
1533	similar to avrRpt2-induced protein 1	1563	60S ribosomal protein L14
1534	unknown protein	1564	unknown protein
1535	hypothetical protein	1565	putative RING-H2 zinc finger protein
1536	putative protein kinase	1566	putative pollen surface protein
1537	respiratory burst oxidase - like protein	1567	unknown protein
1538	glucose-6- phosphate/phosphate- translocator precursor, putative	1568	unknown protein
1539	class 1 non-symbiotic hemoglobin (AHB1)	1569	unknown protein
1540	endochitinase isolog	1570	putative Ca ²⁺ -ATPase
1541	putative cytochrome P450	1571	1-aminocyclopropane-1- carboxylate synthase -like protein
		1572	putative beta-glucosidase
		1573	transcription factor ZAP1
		1574	oligopeptide transporter, putative
		1575	putative protein
		1576	putative glucosyltransferase
		1577	putative serine/threonine kinase
		1578	squalene epoxidase - like protein
		1579	similar to 14KD proline-rich protein DC2.15 precursor

TABLE 1 (cont)

	(sp P14009); similar to ESTs emb Z17709 and emb Z47685	1612	DnaJ-like protein
1580	unknown protein	1613	putative inositol polyphosphate-5-phosphatase
1581	unknown protein	1614	putative cytochrome P450
1582	hypothetical protein	1615	putative protein
1583	60S ribosomal protein L38	1616	unknown protein
1584	flavin-containing monooxygenase, putative	1617	putative protein
1585	remorin	1618	hypothetical protein
1586	unknown protein	1619	putative protein
1587	putative protein	1620	sucrose-UDP glucosyltransferase
1588	lipoxygenase	1621	glucose-6-phosphate 1-dehydrogenase
1589	cold-regulated protein COR6.6 (KIN2)	1622	unknown protein
1590	Myb transcription factor homolog (ATR1)	1623	mitochondrial chaperonin (HSP60)
1591	putative protein	1624	sucrose transport protein SUC1
1592	unknown protein	1625	putative protein disulfide isomerase
1593	unknown protein	1626	putative pollen-specific protein
1594	Ca ²⁺ -transporting ATPase - like protein	1627	integral membrane protein, putative
1595	protein phosphatase 2C (AtP2C-HA)	1628	rubredoxin, putative
1596	peroxidase ATP24a	1629	putative protein
1597	branched-chain alpha keto-acid dehydrogenase, putative	1630	disease resistance protein RPS4, putative
1598	putative beta-ketoacyl-CoA synthase	1631	putative peptide/amino acid transporter
1599	putative protein	1632	peroxidase, putative
1600	putative beta-galactosidase	1633	ethylene receptor, putative (ETR2)
1601	putative protein	1634	protein phosphatase 2C (PP2C)
1602	60S ribosomal protein L27	1635	putative glutathione S-transferase
1603	putative annexin	1636	homeodomain transcription factor (ATHB-7)
1604	NAC domain protein, putative	1637	putative nitrate transporter
1605	unknown protein	1638	putative ribosomal protein L9, cytosolic
1606	late embryogenesis abundant protein LEA like	1639	putative DNA-binding protein
1607	unknown protein	1640	beta-1,3-glucanase-like protein
1608	putative protein	1641	putative zinc transporter
1609	dehydrin Xero2	1642	transcription factor TINY
1610	putative zinc finger protein	1643	putative aspartate kinase-homoserine dehydrogenase
1611	unknown protein	1644	ethylene response factor-like AP2 domain transcription factor
		1645	peptide transporter - like protein
		1646	trehalose-6-phosphate synthase like protein

TABLE 1 (cont)

1647	putative ribonuclease	1676	pathogenesis-related protein 1 precursor, 19.3K
1648	hypothetical protein	1677	R2R3-MYB transcription factor
1649	putative DNA-binding protein	1678	hypothetical protein
1650	nodulin-like protein	1679	putative chitinase
1651	trehalose-6-phosphate phosphatase - like protein	1680	Mlo protein, putative
1652	succinate dehydrogenase flavoprotein alpha subunit (emb CAA05025.1)	1681	putative WRKY-type DNA binding protein
1653	unknown protein	1682	putative acyl-CoA synthetase
1654	stress related protein, putative	1683	putative pathogenesis-related protein
1655	putative chloroplast initiation factor 3	1684	putative chitinase
1656	putative protein	1685	germin precursor oxalate oxidase
1657	hypothetical protein	1686	endoxyloglucan transferase, putative
1658	putative CCCH-type zinc finger protein	1687	putative protein
1659	similar to harpin-induced protein hin1 from tobacco	1688	putative cytochrome P450
1660	unknown protein	1689	similar to Mlo proteins from H. vulgare
1661	unknown protein	1690	putative tropinone reductase
1662	hypothetical protein	1691	extensin-like protein
1663	No function assigned by TIGR	1692	putative sarcosine oxidase
1664	putative protein	1693	putative protein
1665	putative glutathione S-transferase TSI-1	1694	hypothetical protein
1666	putative protein	1695	late embryogenesis-abundant protein, putative
1667	putative PTR2 family peptide transporter	1696	beta-carotene hydroxylase
1668	receptor kinase-like protein	1697	putative calcium binding protein
1669	putative sugar transport protein, ERD6	1698	unknown protein
1670	putative protein	1699	unknown protein
1671	nodulin-like protein	1700	predicted glycosyl transferase
1672	unknown protein	1701	hypothetical protein
1673	putative receptor-like protein kinase	1702	hypothetical protein
1674	glutathione-conjugate transporter AtMRP4	1703	hypothetical protein
1675	ascorbate oxidase-like protein	1704	putative protein
		1705	unknown protein
		1706	putative protein
		1707	putative protein
		1708	serine/threonine kinase - like protein
		1709	No function assigned by TIGR
		1710	putative pectinesterase
		1711	peroxidase like protein
		1712	No function assigned by TIGR

TABLE 1 (cont)

1713	phenylalanine ammonia lyase (PAL1)		Coenzyme A 3-O- methyltransferase
1714	peroxidase (emb CAA68212.1)	1740	disease resistance protein EDS1
1715	putative AMP deaminase	1741	putative protein kinase
1716	putative MYB family transcription factor	1742	Glutathione reductase, chloroplast precursor
1717	DNA-directed RNA polymerase II, third largest subunit	1743	putative heat shock protein
1718	nucleotide pyrophosphatase -like protein	1744	aspartate kinase
1719	putative peroxidase	1745	putative major intrinsic (channel) protein
1720	calcium sensor homolog (gb AAC26110.1)	1746	matrix metalloproteinase, putative
1721	putative GDSL-motif lipase/hydrolase	1747	putative GDSL-motif lipase/hydrolase
1722	putative nonspecific lipid- transfer protein	1748	putative protein
1723	acyl-carrier protein (ACP), putative	1749	DAG-like protein
1724	putative glycine dehydrogenase	1750	serine/threonine kinase -like protein
1725	AIG1	1751	formamidase - like protein
1726	ACC synthase (AtACS-6)	1752	CER2
1727	cyclin delta-3	1753	26S proteasome subunit 4
1728	putative RING zinc finger protein	1754	pectinesterase like protein
1729	aldose 1-epimerase - like protein	1755	putative disease resistance protein
1730	putative phospholipase	1756	putative RNA methyltransferase
1731	phosphoenolpyruvate carboxylase	1757	unknown protein
1732	putative galactinol synthase	1758	HOMEBOX PROTEIN KNOTTED-1 LIKE 4 (KNAT4)
1733	unknown protein	1759	glycine-rich RNA-binding protein AtGRP2 - like
1734	putative protein	1760	putative acetylornithine transaminase
1735	1-aminocyclopropane-1- carboxylate oxidase	1761	putative Sec24-like COPII protein
1736	thioredoxin (clone GIF1) (pir S58118)	1762	putative berberine bridge enzyme
1737	trehalose-6-phosphate phosphatase	1763	putative GH3-like protein
1738	beta-1,3-glucanase 2 (BG2) (PR-2)	1764	putative ABC transporter
1739	putative S-adenosyl-L- methionine:trans-caffeoyl-	1765	putative reticuline oxidase-like protein
		1766	pectate lyase - like protein
		1767	protein disulfide-isomerase-like protein
		1768	putative protein
		1769	putative membrane transporter
		1770	unknown protein
		1771	unknown protein
		1772	putative RING-H2 zinc finger protein

TABLE 1 (cont)

1773	unknown protein	1807	glycine-rich RNA binding protein 7
1774	unknown protein	1808	dehydrin, putative
1775	unknown protein	1809	putative endoxyloglucan glycosyltransferase
1776	MADS-box protein (AGL20)	1810	glutamate decarboxylase 1 (GAD 1) (sp Q42521)
1777	amidophosphoribosyltransf erase 2 precursor	1811	delta 9 desaturase
1778	putative dihydrodipicolinate synthase	1812	UDP-glucose glucosyltransferase
1779	hypothetical protein	1813	CARBONIC ANHYDRASE 2
1780	ABA-responsive protein - like	1814	response reactor 2 (ATRR2)
1781	putative protein	1815	S-adenosyl-methionine-sterol-C- methyltransferase, putative
1782	hypothetical protein	1816	putative DNA-binding protein (RAV2-like)
1783	DNA-binding protein-like	1817	gamma glutamyl hydrolase, putative
1784	No function assigned by TIGR	1818	protein phosphatase - like
1785	transcription factor, putative	1819	unknown protein
1786	nitrate reductase, putative	1820	unknown protein
1787	putative protein	1821	unknown protein
1788	putative protein	1822	copper transport protein - like protein
1789	putative protein	1823	hypothetical protein
1790	putative protein	1824	unknown protein
1791	unknown protein	1825	putative peptide methionine sulfoxide reductase
1792	unknown protein	1826	putative obtusifoliol 14-alpha demethylase
1793	tryptophan synthase beta- subunit (TSB2)	1827	glutamate dehydrogenase (EC 1.4.1.-) 1 (pir S71217)
1794	hypothetical protein	1828	unknown protein
1795	putative protein	1829	xyloglucan endo-1,4-beta-D- glucanase precursor
1796	putative DNA-binding protein	1830	unknown protein
1797	putative 40S ribosomal protein S10	1831	SNF1 related protein kinase (ATSRPK1)
1798	putative protein	1832	putative protein
1799	putative cytochrome P450	1833	putative chloroplast nucleoid DNA binding protein
1800	putative protein	1834	hypothetical protein
1801	putative protein	1835	putative protein
1802	putative glucosyltransferase	1836	putative thiamin biosynthesis protein
1803	No function assigned by TIGR	1837	unknown protein
1804	putative protein		
1805	putative protein		
1806	unknown protein		

TABLE 1 (cont)

1838	unknown protein	1869	putative tyrosine aminotransferase
1839	putative RNA helicase	1870	thionin
1840	putative SF21 protein { <i>Helianthus annuus</i> }	1871	No function assigned by TIGR
1841	unknown protein	1872	APETALA2 protein
1842	NBS/LRR disease resistance protein, putative	1873	MADS-box protein (AGL3)
1843	hypothetical protein	1874	putative monooxygenase
1844	unknown protein	1875	ZFP3 zinc finger protein
1845	No function assigned by TIGR	1876	cell division protein FtsZ chloroplast homolog precursor (sp Q42545)
1846	glycine-rich protein (AtGRP2)	1877	calreticulin, putative
1847	No function assigned by TIGR	1878	phosphoserine aminotransferase
1848	putative protein	1879	12-oxophytodienoate-10,11- reductase
1849	putative glucosyltransferase	1880	putative bHLH transcription factor
1850	hypothetical protein	1881	pectin methylesterase (PMEU1), putative
1851	hypothetical protein	1882	DNA-binding protein
1852	putative protein	1883	carnitine racemase like protein
1853	putative disease resistance protein	1884	putative protein
1854	thaumatin, putative	1885	endoxylglucan transferase (dbj BAA81669.1)
1855	putative proline-rich protein	1886	RMA1 RING zinc finger protein
1856	sterol-C-methyltransferase	1887	ammonium transporter
1857	superoxidase dismutase	1888	apyrase (gb AAF00612.1)
1858	TINY-like protein	1889	potassium uptake transporter - like protein
1859	calcium-dependent protein kinase, putative	1890	putative ABC transporter
1860	hypothetical protein	1891	potassium transporter-like protein
1861	putative protein kinase	1892	integral membrane protein, putative
1862	DNA-directed RNA polymerase (mitochondrial)	1893	putative protein
1863	putative DNA-binding protein	1894	pyruvate decarboxylase-1 (Pdc1)
1864	late embryogenesis abundant M17 protein	1895	putative malate oxidoreductase
1865	putative protein	1896	putative histone H2B
1866	delta-1-pyrroline-5- carboxylate synthetase	1897	snoRNA
1867	putative 60s ribosomal protein L10	1898	symbiosis-related like protein
1868	cytochrome P450 CYP86A1	1899	unknown protein
		1900	unknown protein
		1901	hypothetical protein
		1902	putative protein
		1903	copper-binding protein-like
		1904	putative protein
		1905	unknown protein
		1906	putative glyoxalase II

TABLE 1 (cont)

1907	No function assigned by TIGR	1936	serine/threonine protein kinase, putative
1908	hypothetical protein	1937	potassium transporter - like protein
1909	flavanone 3-hydroxylase (FH3)	1938	lactate dehydrogenase (LDH1)
1910	putative laccase	1939	hypothetical protein
1911	putative protein kinase	1940	unknown protein
1912	myb-related protein, 33.3K (pir S71284)	1941	putative thaumatin
1913	unknown protein	1942	putative reticuline oxidase-like protein
1914	endo-xyloglucan transferase - like protein	1943	uracil phosphoribosyltransferase, putative
1915	TMV resistance protein N - like	1944	transcription factor, putative
1916	putative xyloglucan endotransglycosylase	1945	unknown protein
1917	unknown protein	1946	unknown protein
1918	proline transporter 2	1947	GATA transcription factor 4
1919	resistance protein, putative	1948	unknown protein
1920	actin, putative	1949	unknown protein
1921	putative related to microbial divalent cation tolerance proteins	1950	senescence-associated protein -like
1922	unknown protein	1951	putative pollen allergen
1923	putative glycosyl transferase	1952	unknown protein
1924	unknown protein	1953	putative protein
1925	putative protein phosphatase 2C	1954	glycine-rich protein
1926	unknown protein	1955	putative protein
1927	serpin, putative	1956	3-methyladenine DNA glycosylase, putative
1928	cinnamyl-alcohol dehydrogenase CAD1	1957	endoplasmic reticulum-type calcium-transporting ATPase 4
1929	putative protein import receptor	1958	putative pectinesterase
1930	unknown protein	1959	cytochrome P450-like protein
1931	unknown protein	1960	RNA-binding protein (cp33)
1932	putative protein	1961	CONSTANS-like 1
1933	putative CDP-diacylglycerol--glycerol-3-phosphate 3-phosphatidyltransferase	1962	putative small heat shock protein
1934	unknown protein	1963	hypothetical protein
1935	putative LRR receptor-like protein kinase	1964	unknown protein
		1965	cytochrome P450 - like protein
		1966	cysteine proteinase inhibitor like protein
		1967	nicotianamine synthase (dbj BAA74589.1)
		1968	copper amine oxidase like protein (fragment2)
		1969	putative SCARECROW gene regulator
		1970	unknown protein
		1971	unknown protein

TABLE 1 (cont)

1972	putative alanine acetyl transferase	2001	auxin response factor 1
1973	unknown protein	2002	pathogenesis-related protein 1 precursor, 18.9K
1974	unknown protein	2003	hypothetical protein
1975	unknown protein	2004	unknown protein
1976	putative extensin	2005	zinc finger protein Zat12
1977	putative protein kinase	2006	unknown protein
1978	putative protein kinase	2007	unknown protein
1979	NADPH-dependent codeinone reductase, putative	2008	cyclin, putative
1980	peroxidase	2009	2-dehydro-3-deoxyphosphoheptonate aldolase
1981	putative cytochrome P450	2010	glutathione synthetase gsh2
1982	No function assigned by TIGR	2011	heat shock protein 17
1983	putative zinc-finger protein (B-box zinc finger domain)	2012	putative Na ⁺ -dependent inorganic phosphate cotransporter
1984	putative tyrosine aminotransferase	2013	No function assigned by TIGR
1985	hypothetical protein	2014	unknown protein
1986	DNA binding protein	2015	putative protein
1987	putative fatty acid elongase	2016	similar to RING-H2 finger protein RHC1a GB:AAC69854 GI:3790583 from [Arabidopsis thaliana]
1988	bZIP transcription factor - like protein	2017	calcium-binding protein - like
1989	xyloglucan fucosyltransferase, putative	2018	putative protein
1990	unknown protein	2019	putative aldehyde dehydrogenase
1991	unknown protein	2020	auxin-responsive GH3 - like protein
1992	putative protein	2021	putative protein
1993	myb factor, putative	2022	Phosphoglycerate dehydrogenase - like protein
1994	Myb-family transcription factor, putative	2023	unknown protein
1995	putative fructose biphosphate aldolase	2024	unknown protein
1996	myrosinase-associated protein, putative	2025	PSI type III chlorophyll a/b-binding protein, putative
1997	cytochrome P450 like protein	2026	putative protein
1998	similar to SOR1 from the fungus <i>Cercospora nicotianae</i>	2027	putative protein
1999	similar to embryo-abundant protein GB:L47672 GI:1350530 from [<i>Picea glauca</i>]	2028	glutaredoxin, putative
2000	alcohol dehydrogenase	2029	hypothetical protein
		2030	No function assigned by TIGR
		2031	putative protein
		2032	jasmonate inducible protein, putative
		2033	putative polygalacturonase isoenzyme 1 beta subunit
		2034	putative small heat shock protein

TABLE 1 (cont)

2035	unknown protein	2068	putative chlorophyll A-B binding protein
2036	putative disease resistance protein	2069	Lhcb3 chlorophyll a/b binding protein (gb AAD28773.1)
2037	putative protein	2070	luminal binding protein (dbj BAA13948.1)
2038	ethylene-responsive element binding factor, putative	2071	hydroxypyruvate reductase (HPR)
2039	putative protein	2072	epoxide hydrolase (ATsEH)
2040	Pollen-specific protein precursor like	2073	putative protein (fragment)
2041	putative protein	2074	unknown protein
2042	unknown protein	2075	hypothetical protein
2043	EF-Hand containing protein-like	2076	putative glucosyl transferase
2044	unknown protein	2077	putative glucosyl transferase
2045	putative calcium-transporting ATPase	2078	putative 3-methylcrotonyl-CoA carboxylase
2046	antifungal protein-like (PDF1.2)	2079	putative peroxidase
2047	pathogenesis-related PR-1-like protein	2080	acyl-CoA oxidase (gb AAC13497.1)
2048	similar to Mlo proteins from <i>H. vulgare</i>	2081	alternative oxidase 1a precursor
2049	putative steroid sulfotransferase	2082	putative transcription factor (MYB4)
2050	trehalase - like protein	2083	serine acetyltransferase
2051	thioredoxin fl	2084	ATP-sulfurylase
2052	unknown protein	2085	calreticulin (crt1)
2053	alanine-glyoxylate aminotransferase	2086	putative prohibitin 2
2054	integral membrane protein, putative	2087	putative monodehydroascorbate reductase
2055	hypothetical protein	2088	branched-chain alpha-keto acid decarboxylase E1 beta subunit
2056	unknown protein	2089	cytokinin oxidase - like protein
2057	hypothetical protein	2090	putative receptor-like protein kinase
2058	unknown protein	2091	unknown protein
2059	unknown protein	2092	hypothetical protein
2060	unknown protein	2093	No function assigned by TIGR
2061	drought-induced-19-like 1	2094	putative APG protein
2062	unknown protein	2095	glutathione S-transferase, putative
2063	putative protein	2096	phytochrome-associated protein 1 (PAP1)
2064	putative protein	2097	amidophosphoribosyltransferase
2065	AIG2-like protein	2098	nonphototropic hypocotyl 1
2066	Lhca2 protein	2099	3-keto-acyl-CoA thiolase 2 (gb AAC17877.1)
2067	phytocyanin	2100	pEARLI 1
		2101	glutathione reductase, cytosolic

TABLE 1 (cont)

2102	putative protein	2128	putative protein disulfide-isomerase
2103	putative protein	2129	unknown protein
2104	putative aldehyde oxidase	2130	beta-1,3-glucanase class I precursor
2105	probable photosystem I chain XI precursor	2131	homeobox-leucine zipper protein HAT5 (HD-ZIP protein 5) (HD-ZIP protein ATHB-1)
2106	photosystem II polypeptide, putative	2132	putative cyclic nucleotide-regulated ion channel protein
2107	photosystem II reaction center 6.1KD protein	2133	P II nitrogen sensing protein GLB I
2108	33 kDa polypeptide of oxygen-evolving complex (OEC) in photosystem II (emb CAA75629.1)	2134	H-protein promoter binding factor-1 (gb AAC24592.1)
2109	60S ribosomal protein L11B	2135	GAST1-like protein
2110	extA (emb CAA47807.1)	2136	cytochrome P450 GA3
2111	zinc finger protein OBP4 - like	2137	putative protein
2112	sterol delta7 reductase	2138	Myb-related transcription factor-like protein
2113	putative RAS-related protein, RAB11C	2139	putative phloem-specific lectin
2114	glucosyltransferase like protein	2140	protein kinase - like protein
2115	zinc finger protein (PMZ), putative	2141	unknown protein
2116	6,7-dimethyl-8-ribityllumazine synthase precursor	2142	SCARECROW transcriptional regulator-like
2117	putative protein	2143	unknown protein
2118	osmotin precursor	2144	unknown protein
2119	No function assigned by TIGR	2145	putative protein
2120	ferredoxin precursor isolog	2146	calnexin homolog
2121	GH3 like protein	2147	PP1/PP2A phosphatases
2122	non-specific lipid transfer protein		pleiotropic regulator PRL2
2123	homeodomain transcription factor (HAT9)	2148	xyloglucan endotransglycosylase, putative
2124	putative cytochrome P450 monooxygenase	2149	putative calmodulin
2125	putative protein kinase	2150	spermine synthase (ACL5)
2126	putative protein	2151	snoRNA
2127	glyceraldehyde-3-phosphate dehydrogenase	2152	photosystem I subunit V precursor, putative
		2153	putative potassium transporter
		2154	Homeodomain - like protein
		2155	putative protein
		2156	unknown protein
		2157	CALMODULIN-RELATED PROTEIN 2, TOUCH-INDUCED (TCH2)
		2158	putative protein phosphatase 2C

TABLE 1 (cont)

2159	monosaccharide transport protein, STP4	2187	defender against cell death protein
2160	hypothetical protein	2188	AP2 domain containing protein, putative
2161	unknown protein	2189	actin depolymerizing factor - like protein
2162	hypothetical protein	2190	putative calcium-dependent protein kinase (U90439)
2163	putative protein kinase	2191	phosphoribosylanthranilate transferase, putative
2164	putative serine/threonine protein kinase	2192	oligopeptide transporter, putative
2165	jasmonate inducible protein, putative	2193	calmodulin-like protein
2166	similar to several small proteins (~100 aa) that are induced by heat, auxin, ethylene and wounding such as Phaseolus aureus indole-3-acetic acid induced protein ARG (SW:32292)	2194	putative protease inhibitor
2167	unknown protein	2195	MAP kinase
2168	MYB-like protein	2196	DNA binding protein MybSt1, putative
2169	putative protein kinase	2197	putative protein
2170	unknown protein	2198	putative protein
2171	CLC-d chloride channel protein	2199	unknown protein
2172	cytochrome P450-like protein	2200	unknown protein
2173	putative glutathione S-transferase	2201	unknown protein
2174	putative mandelonitrile lyase	2202	putative protein
2175	hypothetical protein	2203	unknown protein
2176	putative trypsin inhibitor	2204	unknown protein
2177	male sterility 2-like protein (emb CAA68191.1)	2205	hypothetical protein
2178	unknown protein	2206	uncharacterized protein
2179	unknown protein	2207	putative protein
2180	putative protein	2208	hypothetical protein
2181	putative peroxidase	2209	peroxidase (emb CAA66967.1)
2182	putative thromboxane-A synthase	2210	putative flavonol 3-O-glucosyltransferase
2183	putative cytochrome P450	2211	putative flavonol 3-O-glucosyltransferase
2184	peroxidase ATP21a	2212	putative protein
2185	unknown protein	2213	glycerol-3-phosphate acyltransferase
2186	putative glutathione S-transferase	2214	putative beta-1,3-glucanase
		2215	putative ethylene response element binding protein (EREBP)
		2216	putative CONSTANS-like B-box zinc finger protein
		2217	putative protein
		2218	unknown protein
		2219	putative trehalose-6-phosphate phosphatase (AtTPPA)
		2220	putative protein

TABLE 1 (cont)

2221	putative protein	2251	lysine and histidine specific transporter, putative
2222	unknown protein	2252	putative protein
2223	unknown prptein	2253	putative protein
2224	unknown protein	2254	putative sugar transporter protein
2225	hypothetical protein	2255	12S cruciferin seed storage protein
2226	putative metal-binding protein	2256	putative auxin-induced protein, IAA17/AXR3-1
2227	putative phosphoribosylglycinamide synthetase	2257	putative cyclin D
2228	unknown protein	2258	farnesyl diphosphate synthase precursor (gb AAB49290.1)
2229	putative protein	2259	putative potassium transport protein (TRH1)
2230	unknown protein	2260	putative NPK1-related MAP kinase
2231	unknown protein	2261	putative protein
2232	putative beta-galactosidase	2262	putative ABC transporter
2233	putative protein kinase	2263	putative DNA-directed RNA polymerase subunit
2234	putative protein	2264	putative small nuclear ribonucleoprotein E
2235	putative protein phosphatase 2C	2265	unknown protein
2236	putative growth regulator protein	2266	reticuline oxidase - like protein
2237	putative ABC transporter	2267	putative 1-aminocyclopropane-1-carboxylate oxidase
2238	chloride channel (emb CAA70310.1)	2268	similar to Mlo proteins from H. vulgare
2239	adrenodoxin - like protein	2269	long-chain-fatty-acid--CoA ligase-like protein
2240	NAM (no apical meristem)-like protein	2270	putative protein
2241	putative transcription factor MYB41	2271	chromatin remodelling complex ATPase chain ISWI -like protein
2242	Myb DNA binding protein - like	2272	hypothetical protein
2243	AtMYB84	2273	latex-abundant protein, putative
2244	photosystem II type I chlorophyll a/b binding protein	2274	N-acetylornithine deacetylase-like protein, fragment
2245	putative aspartic proteinase	2275	putative DNA-binding protein
2246	jasmonate inducible protein, putative	2276	putative anthranilate N-hydroxycinnamoyl/benzoyltransferase
2247	putative protein	2277	putative DNA binding protein
2248	No function assigned by TIGR	2278	cytochrome P450 - like protein
2249	putative phosphatidylserine synthase	2279	putative DNA-binding protein
2250	putative nicotianamine synthase	2280	putative peptide transporter
		2281	putative reticuline oxidase-like protein

TABLE 1 (cont)

2282	thioredoxin, putative	2313	putative protein kinase
2283	nodulin-like protein	2314	indoleacetic acid (IAA)-inducible gene (IAA7)
2284	UDP-galactose transporter - like protein	2315	ATP-dependent Clp protease regulatory subunit CLPX
2285	putative fibrillin	2316	DNA-binding protein RAV1
2286	unknown protein	2317	putative protein
2287	unknown protein	2318	hypothetical protein
2288	unknown protein	2319	unknown protein
2289	hypothetical protein	2320	unknown protein
2290	glyceraldehyde 3-phosphate dehydrogenase A subunit (GapA)	2321	putative protein
2291	predicted protein of unknown function	2322	putative thioredoxin reductase
2292	putative protein	2323	unknown protein
2293	putative protein	2324	putative lectin
2294	myb-like protein	2325	No function assigned by TIGR
2295	hypothetical protein	2326	beta-fructosidase
2296	putative U5 small nuclear ribonucleoprotein, an RNA helicase	2327	chlorophyll a/b-binding protein CP29
2297	unknown protein	2328	photosystem I subunit PSI-E - like protein
2298	cinnamyl alcohol dehydrogenase - like protein	2329	peroxidase ATP8a
2299	hypothetical protein similar to extensin-like protein	2330	putative fructose bisphosphate aldolase
2300	unknown protein	2331	zinc finger protein ATZF1, putative
2301	putative chlorophyll a/b binding protein	2332	DegP protease precursor
2302	probable plasma membrane intrinsic protein 1c	2333	transcription factor-like protein
2303	hexokinase (ATHXK2)	2334	calcium-dependent protein kinase
2304	calcium-dependent protein kinase	2335	hypothetical protein
2305	5'-adenylylphosphosulfate reductase, putative	2336	putative protein
2306	Erd1 protein precursor (sp P42762)	2337	glucose-1-phosphate adenylyltransferase (APL3)
2307	putative protein	2338	No function assigned by TIGR
2308	putative protein	2339	putative Eukaryotic initiation factor 4A
2309	unknown protein	2340	No function assigned by TIGR
2310	BCS1 protein-like protein	2341	unknown protein
2311	putative protein	2342	beta tubulin 1, putative
2312	putative protein	2343	one helix protein (OHP)
		2344	No function assigned by TIGR
		2345	zinc finger protein 5, ZFP5
		2346	putative MYB family transcription factor
		2347	putative amino acid transporter protein

TABLE 1 (cont)

2348	putative potassium transporter	2374	putative PHD-type zinc finger protein
2349	protein kinase (AFC2)	2375	nuclear RNA binding protein A-like protein
2350	putative protein	2376	unknown protein
2351	No function assigned by TIGR	2377	unknown protein
2352	putative ubiquitin-conjugating enzyme E2	2378	unknown protein
2353	unknown protein	2379	putative amino-cyclopropane-carboxylic acid oxidase (ACC oxidase)
2354	cytochrome P450 monooxygenase (CYP71B3)	2380	hypothetical protein
2355	putative myrosinase-binding protein	2381	indole-3-acetate beta-glucosyltransferase like protein
2356	putative vacuolar sorting receptor	2382	predicted protein
2357	uridine diphosphate glucose epimerase	2383	unknown protein
2358	shaggy related protein kinase, ASK-GAMMA	2384	No function assigned by TIGR
2359	ankyrin repeat protein EMB506	2385	putative photosystem I reaction center subunit IV
2360	putative beta-alanine-pyruvate aminotransferase	2386	putative homeodomain transcription factor
2361	putative alcohol dehydrogenase	2387	putative purple acid phosphatase precursor
2362	putative receptor-like protein kinase	2388	No function assigned by TIGR
2363	unknown protein	2389	nitrate reductase 1 (NR1)
2364	putative methylmalonate semi-aldehyde dehydrogenase	2390	putative casein kinase II beta subunit
2365	hypothetical protein	2391	pEARLI 1-like protein
2366	unknown protein	2392	putative protein
2367	peroxidase ATP13a	2393	No function assigned by TIGR
2368	putative glutathione peroxidase	2394	unknown protein
2369	squamosa promoter binding protein-like 7	2395	putative cell wall-plasma membrane disconnecting CLCT protein (AIR1A)
2370	photosystem II core complex protein, putative	2396	unknown protein
2371	snoRNA	2397	scarecrow-like 11 - like
2372	photosystem I subunit X precursor	2398	putative anthocyanidin synthase
2373	MYB transcription factor (Atmyb2)	2399	putative AP2 domain transcription factor
		2400	caffeoyl-CoA O-methyltransferase - like protein
		2401	unknown protein
		2402	putative protein kinase
		2403	cytochrome P450 -like protein
		2404	putative MADS-box protein ANR1
		2405	putative glutathione S-transferase

TABLE 1 (cont)

2406	hypothetical protein	2437	putative protein
2407	similar to gibberellin-regulated proteins	2438	unknown protein
2408	unknown protein	2439	unknown protein
2409	putative sensory transduction histidine kinase	2440	putative protein
2410	similar to late embryogenesis abundant proteins	2441	No function assigned by TIGR
2411	unknown protein	2442	MADS-box protein AGL14
2412	putative protein	2443	No function assigned by TIGR
2413	putative ATP-dependent RNA helicase	2444	peptidylprolyl isomerase
2414	putative protein	2445	putative s-adenosylmethionine synthetase
2415	putative sucrose synthetase	2446	peroxidase
2416	beta-fructofuranosidase 1	2447	ferrochelataase-I
2417	putative indole-3-acetate beta-glucosyltransferase	2448	putative eukaryotic initiation factor 4, eIF4
2418	hypothetical protein	2449	drought-inducible cysteine proteinase RD21A precursor -like protein
2419	DNA-directed RNA polymerase II, third largest subunit	2450	unknown protein
2420	putative transcription factor	2451	unknown protein
2421	homeobox-leucine zipper protein ATHB-5 (HD-zip protein ATHB-5) (sp P46667)	2452	No function assigned by TIGR
2422	putative ftsH chloroplast protease	2453	No function assigned by TIGR
2423	replication protein A1 - like	2454	salt-inducible like protein
2424	hypothetical protein	2455	glucose-6-phosphate 1-dehydrogenase
2425	unknown protein	2456	3-hydroxy-3-methylglutaryl CoA reductase (AA 1-592)
2426	unknown protein	2457	hypothetical protein
2427	putative methionine aminopeptidase	2458	putative protein
2428	unknown protein	2459	putative putative 60S ribosomal protein L17
2429	fatty acid elongase - like protein (cer2-like)	2460	putative inorganic pyrophosphatase
2430	unknown protein	2461	putative gamma-glutamyltransferase
2431	putative disease resistance response protein	2462	heat shock transcription factor - like protein
2432	putative protein	2463	mitochondrial chaperonin hsp60
2433	unknown protein	2464	unknown protein
2434	putative protein	2465	putative zinc finger protein identical to T10M13.22
2435	putative protein	2466	putative uridylyl transferase
2436	unknown protein	2467	nodulin-like protein
		2468	putative B-box zinc finger protein
		2469	No function assigned by TIGR
		2470	putative metalloproteinase

TABLE 1 (cont)

2471	putative cellular apoptosis susceptibility protein	2504	unknown protein
2472	hypothetical protein	2505	unknown protein
2473	hypothetical protein	2506	60S ribosomal protein L10A
2474	scarecrow-like 13 (SCL13)	2507	putative protein
2475	putative nucleoside triphosphatase	2508	receptor protein kinase (IRK1), putative
2476	unknown protein	2509	putative nematode-resistance protein
2477	No function assigned by TIGR	2510	tubulin alpha-5 chain-like protein
2478	hypothetical protein	2511	putative DNA-binding protein
2479	putative phospholipase	2512	unknown protein
2480	putative snRNP protein	2513	putative RGA1, giberellin response modulation protein
2481	putative protein	2514	non phototropic hypocotyl 1-like
2482	putative lipase	2515	RING-H2 finger protein RHA1b
2483	putative nonsense-mediated mRNA decay protein	2516	putative myb-protein
2484	No function assigned by TIGR	2517	hydroperoxide lyase (HPOL) like protein
2485	protochlorophyllide reductase precursor	2518	serine/threonine-protein kinase, PK7
2486	No function assigned by TIGR	2519	putative vacuolar proton-ATPase subunit
2487	trehalose-6-phosphate synthase, putative	2520	putative polygalacturonase
2488	unknown protein	2521	putative ribosomal protein L8
2489	germin-like protein	2522	putative adenylate kinase
2490	plastid protein	2523	germin-like protein (GLP10)
2491	putative protein	2524	putative chlorophyll a/b binding protein
2492	hypothetical protein	2525	chloroplast single subunit DNA-dependent RNA polymerase
2493	unknown protein	2526	putative protein
2494	unknown protein	2527	hypothetical protein
2495	histone deacetylase-like protein	2528	hypothetical protein
2496	unknown protein	2529	b-keto acyl reductase, putative
2497	unknown protein	2530	cellulose synthase catalytic subunit
2498	putative protein	2531	putative 1-aminocyclopropane-1-carboxylate oxidase
2499	putative protein	2532	S-linalool synthase, putative
2500	No function assigned by TIGR	2533	phosphoribosyl-ATP pyrophosphohydrolase (At-IE)
2501	putative zinc transporter ZIP2 - like	2534	disease resistance RPP5 like protein (fragment)
2502	unknown protein	2535	putative protein
2503	putative ribosomal-protein S6 kinase (ATPK19)	2536	beta-galactosidase like protein

TABLE 1 (cont)

2537	putative translation initiation factor eIF-2, gamma subunit	2566	unknown protein
2538	ankyrin like protein	2567	unknown protein
2539	histone H2A- like protein	2568	unknown protein
2540	putative protein	2569	serine/threonine kinase - like protein
2541	salt-tolerance zinc finger protein	2570	peroxidase (emb CAA66960.1)
2542	unknown protein	2571	putative protein
2543	putative protein	2572	hypothetical protein
2544	fructose-bisphosphate aldolase	2573	glycine-rich protein 2 (GRP2)
2545	peroxidase (emb CAA66964.1)	2574	unknown protein
2546	patatin-like protein	2575	berberine bridge enzyme-like protein
2547	salt-inducible protein homolog	2576	unknown protein
2548	hypothetical protein	2577	putative WD-repeat protein
2549	xyloglucan endo-transglycosylase-like protein	2578	serine/threonine kinase - like protein
2550	trihelix DNA-binding protein (GT2)	2579	serine /threonine kinase - like protein
2551	ubiquitin-conjugating enzyme 16, putative	2580	Cu ²⁺ -transporting ATPase-like protein
2552	homeobox protein	2581	translation initiation factor eIF4E
2553	envelope Ca ²⁺ -ATPase	2582	O-methyltransferase - like protein
2554	snap25a	2583	translation initiation factor eIF3 - like protein
2555	putative annexin	2584	No function assigned by TIGR
2556	putative protein	2585	unknown protein
2557	homeodomain transcription factor (ATHB-14)	2586	hypothetical protein
2558	heat shock protein, putative	2587	unknown protein
2559	peroxidase ATP23a	2588	unknown protein
2560	p68 RNA helicase, putative	2589	glycine-rich protein like
2561	potassium transporter, putative	2590	putative disease resistance protein
2562	putative eukaryotic translation initiation factor 2 alpha subunit, eIF2	2591	putative Na ⁺ /Ca ²⁺ antiporter
2563	hypothetical protein	2592	putative hydroxymethylglutaryl-CoA lyase
2564	carnitine racemase like protein	2593	putative phosphoribosylaminoimidazole carboxylase
2565	No function assigned by TIGR	2594	SAR DNA-binding protein - like
		2595	response regulator, putative
		2596	fibrillin precursor-like protein
		2597	beta-ketoacyl-CoA synthase (FIDDLEHEAD)
		2598	lectin like protein
		2599	No function assigned by TIGR

TABLE 1 (cont)

2600	acidic endochitinase (dbj BAA21861.1)	2629	unknown protein
2601	unknown protein	2630	unknown protein
2602	hypothetical protein	2631	unknown protein
2603	predicted OR23 protein of unknown function	2632	nucleosome assembly protein I-like protein
2604	putative protein	2633	membrane channel like protein
2605	hypothetical protein	2634	anthocyanin2, putative
2606	glycerol-3-phosphate dehydrogenase	2635	TWIN SISTER OF FT (TSF)
2607	hypothetical protein	2636	putative myb-related transcription factor
2608	tat-binding protein, putative	2637	hypothetical protein
2609	putative protein	2638	putative RING zinc finger protein
2610	putative trehalose-6- phosphate phosphatase	2639	amino acid transport protein AAT1
2611	hypothetical protein	2640	putative protein
2612	putative flavonol 3-O- glucosyltransferase	2641	putative protein
2613	60S ribosomal protein L30	2642	xanthine dehydrogenase
2614	putative auxin-induced protein	2643	xanthine dehydrogenase - like protein
2615	putative nonspecific lipid- transfer protein precursor	2644	receptor protein kinase (IRK1), putative
2616	AtRer1A	2645	dehydrin-like protein
2617	putative aquaporin (tonoplast intrinsic protein gamma)	2646	unknown protein
2618	hypothetical protein	2647	aldehyde dehydrogenase homolog, putative
2619	putative alanine acetyl transferase	2648	Ran binding protein (AtRanBP1b)
2620	putative NADP-dependent glyceraldehyde-3- phosphate dehydrogenase	2649	putative squamosa-promoter binding protein
2621	putative DNA binding protein	2650	putative protein
2622	putative cystathionine gamma-synthase	2651	kinesin like protein
2623	unknown protein	2652	putative cellulose synthase
2624	malate oxidoreductase (malic enzyme)	2653	calmodulin (cam2)
2625	unknown protein	2654	fibrillarin - like protein
2626	cyclic nucleotide-gated cation channel	2655	putative transmembrane protein G5p
2627	glyoxalase II, putative	2656	putative peroxidase
2628	putative trypsin inhibitor	2657	putative SNF1-related protein kinase
		2658	glutathione S-transferase, putative
		2659	unknown protein
		2660	hypothetical protein
		2661	putative protein
		2662	phosphatidylinositol-4-phosphate 5-kinase isolog
		2663	putative tyrosine decarboxylase
		2664	unknown protein

TABLE 1 (cont)

2665	SGP1 monomeric G-protein (emb CAB54517.1)	2691	putative pyrophosphate-dependent phosphofructokinase alpha subunit
2666	putative serine carboxypeptidase II	2692	putative flavonol glucosyltransferase
2667	putative L5 ribosomal protein	2693	peroxidase ATP20a (emb CAA67338.1)
2668	putative glucosyltransferase	2694	TOPP8 serine/threonine protein phosphatase type one
2669	flavonoid 3,5-hydroxylase like protein	2695	auxin regulated protein IAA18, putative
2670	putative protein	2696	putative WRKY-type DNA binding protein
2671	putative protein	2697	putative glucan synthase
2672	putative Fe(II)/ascorbate oxidase	2698	squalene monooxygenase
2673	putative anthocyanin 5- aromatic acyltransferase	2699	putative proline-rich protein
2674	casein kinase I	2700	G2484-1 protein
2675	putative 2,3- bisphosphoglycerate- independent phosphoglycerate mutase	2701	heat shock protein 70 like protein
2676	putative glutathione S- transferase TSI-1	2702	unknown protein
2677	ATP-dependent RNA helicase	2703	unknown protein
2678	putative cytochrome P450		
2679	putative WD-40 repeat protein		
2680	No function assigned by TIGR		
2681	No function assigned by TIGR		
2682	putative protein		
2683	putative extensin		
2684	nodulin-26 - like protein		
2685	RNA helicase (emb CAA09212.1)		
2686	predicted protein of unknown function		
2687	putative berberine bridge enzyme		
2688	thioredoxin, putative		
2689	putative serine carboxypeptidase I		
2690	cytochrome P450-like protein		

TABLE 2

ABIOTIC STRESS RESPONSIVE GENE REGULATORY SEQUENCES

What is claimed is:

1. A method of identifying a stress condition to which a plant cell has been exposed, the method comprising:

5 a) contacting nucleic acid molecules representative of expressed polynucleotides in the plant cell with an array of probes representative of the plant cell genome; and

b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response, thereby identifying the stress condition to which the plant cell was exposed.

10

2. The method of claim 1, wherein the stress condition is an abiotic stress condition.

15 3. The method of claim 2, wherein the abiotic stress is a cold stress condition, an osmotic stress condition, a saline stress condition, or a combination thereof.

4. The method of claim 1, wherein the profile is characteristic of exposure to a single stress condition.

20 5. The method of claim 1, wherein the profile is characteristic of a cold stress response, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:1-155, 157-229, 230-232, 234-557, 559-572, 574-605, 607-634, 636-634, 636-786, 788-812, and 814-1261.

25 6. The method of claim 1, wherein the profile is characteristic of a cold stress response, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:1-1261.

30 7. The method of claim 1, wherein the profile is characteristic of an osmotic stress response, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:2428-2585.

8. The method of claim 1, wherein the profile is characteristic of a saline stress response, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:2227-2427.

5 9. The method of claim 2, wherein the profile is characteristic of exposure to at least two abiotic stress conditions.

10 10. The method of claim 9, wherein the abiotic stress conditions are cold and osmotic stress conditions, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:1699-1725, 1727-1865, 1867-1917, 1919-1927, and 1929-1969.

15 11. The method of claim 9, wherein the abiotic stress conditions are cold and osmotic stress conditions, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:1699-1969.

20 12. The method of claim 9, wherein the abiotic stress conditions are cold and saline stress conditions, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:1970-2226.

 13. The method of claim 9, wherein the abiotic stress conditions are osmotic and saline stress conditions, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:2586-2703.

25 14. The method of claim 9, wherein the abiotic stress conditions are cold, osmotic and saline stress conditions, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:1262, 1264-1386, 1387-1390, 1392-1404, 1406-1444, 1446-1483, 1485-1588, 1590-1608, 1610-1633, and 1634-1698.

30 15. The method of claim 9, wherein the abiotic stress conditions are cold, osmotic and saline stress conditions, and wherein the expressed polynucleotides comprise one or a plurality of SEQ ID NOS:1262-1698.

16. The method of claim 1, wherein the nucleic acid molecules representative of expressed polynucleotides in the plant cell are RNA molecules or cDNA molecules.

5

17. The method of claim 1, wherein the array of probes representative of the plant cell genome is immobilized on a microchip.

18. A method for determining whether a test plant has been exposed to an abiotic stress, the method comprising contacting nucleic acid molecules representative of expressed polynucleotides in cells of the test plant with at least one nucleic acid probe under conditions suitable for selective hybridization to a complementary nucleotide sequence,

15 wherein the probe comprises at least 15 nucleotides of a plant stress-regulated gene, provided said gene does not comprise a nucleotide sequence of a polynucleotide as set forth in any of SEQ ID NOS:156, 229, 233, 558, 573, 606, 635, 787, 813, 1263, 1386, 1391, 1405, 1445, 1484, 1589, 1609, 1634, 1726, 1866, 1918 or 1928, or a nucleotide sequence complementary thereto,

whereby

20 detecting selective hybridization of at least one nucleic acid probe, or detecting a change in a level of selective hybridization as compared to a level of selective hybridization obtained using nucleic acid molecules representative of expressed polynucleotides in cells of a plant known not have been exposed to an abiotic stress,

25 indicates that the test plant has been exposed to an abiotic stress, and whereby an absence of selective hybridization of at least one nucleic acid probe indicates that the test plant has not been exposed to an abiotic stress.

19. The method of claim 18, wherein the abiotic stress is cold stress, and wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1-155, 157-228, 230-232, 234-557, 559-572, 574-605, 607-634, 636-786, 788-812, 814-1261 or a nucleotide sequence complementary thereto.

20. The method of claim 18, wherein the abiotic stress is saline stress, and wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:2226-2427 or a nucleotide sequence complementary thereto.

21. The method of claim 18, wherein the abiotic stress is osmotic stress, and wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in two or more of SEQ ID NOS:2428-2585 or a nucleotide sequence complementary thereto.

22. A method for determining whether a test plant has been exposed to a cold stress, the method comprising contacting nucleic acid molecules representative of expressed polynucleotides in cells of the test plant with at least one nucleic acid probe under conditions suitable for selective hybridization to a complementary nucleotide sequence,

wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1-155, 157-228, 230-232, 234-557, 559-572, 574-605, 607-634, 636-786, 788-812, 814-1261, or a nucleotide sequence complementary thereto,

whereby

detecting selective hybridization of at least one nucleic acid probe, or detecting a change in a level of selective hybridization as compared to a level of selective hybridization obtained using nucleic acid molecules representative of expressed polynucleotides in cells of a plant known not have been exposed to a cold stress,

indicates that the test plant has been exposed to a cold stress, and

whereby an absence of selective hybridization of at least one nucleic acid probe indicates that the test plant has not been exposed to a cold stress.

23. A method for determining whether a test plant has been exposed to a saline stress, the method comprising contacting nucleic acid molecules representative of expressed polynucleotides in cells of the test plant with at least one nucleic acid probe under conditions suitable for selective hybridization to a complementary nucleotide sequence,

wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:2226-2427, or a nucleotide sequence complementary thereto,

whereby

detecting selective hybridization of at least one nucleic acid probe, or detecting a change in a level of selective hybridization as compared to a level of selective hybridization obtained using nucleic acid molecules representative of expressed polynucleotides in cells of a plant known not have been exposed to a saline stress,

indicates that the test plant has been exposed to a saline stress, and whereby an absence of selective hybridization of at least one nucleic acid probe indicates that the test plant has not been exposed to a saline stress.

24. A method for determining whether a test plant has been exposed to an osmotic stress, the method comprising contacting nucleic acid molecules representative of expressed polynucleotides in cells of the test plant with at least one nucleic acid probe under conditions suitable for selective hybridization to a complementary nucleotide sequence,

wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in two or more of SEQ ID NOS:2428-2585, or a nucleotide sequence complementary thereto,

whereby

detecting selective hybridization of at least one nucleic acid probe, or
detecting a change in a level of selective hybridization as compared to
a level of selective hybridization obtained using nucleic acid molecules
representative of expressed polynucleotides in cells of a plant known not have
been exposed to an osmotic stress,

indicates that the test plant has been exposed to an osmotic stress, and
whereby an absence of selective hybridization of at least one nucleic acid
probe indicates that the test plant has not been exposed to an osmotic stress.

10

25. A method for determining whether a test plant has been exposed to a
combination of abiotic stress conditions, the method comprising contacting nucleic
acid molecules representative of expressed polynucleotides in cells of the test plant
with at least one nucleic acid probe under conditions suitable for selective

15 hybridization to a complementary nucleotide sequence,

whereby

detecting selective hybridization of at least one nucleic acid probe, or
detecting a change in a level of selective hybridization as compared to
a level of selective hybridization obtained using nucleic acid molecules
representative of expressed polynucleotides in cells of a plant known not have
been exposed to a combination of stress conditions,

20

indicates that the test plant has been exposed to a combination of
abiotic stress conditions, and

whereby an absence of selective hybridization of at least one nucleic acid
probe indicates that the test plant has not been exposed to a combination of abiotic
stress conditions.

25

26. The method of claim 25, wherein the combination of abiotic stress
conditions is a combination of a cold stress and an osmotic stress, and wherein the
probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of
SEQ ID NOS:1699-1969, or a nucleotide sequence complementary thereto.

30

27. The method of claim 25, wherein the combination of abiotic stress conditions is a combination of a cold stress and a saline stress, and wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1970-2226, or a nucleotide sequence complementary thereto.

5

28. The method of claim 25, wherein the combination of abiotic stress conditions is a combination of an osmotic stress and a saline stress, and wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:2586-2703, or a nucleotide sequence complementary thereto.

10

29. The method of claim 25, wherein the combination of abiotic stress conditions is a combination of a cold stress, a saline stress and an osmotic stress, and wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1262-1698, or a nucleotide sequence complementary thereto.

15

30. A method for determining whether a test plant has been exposed to a cold stress and an osmotic stress, the method comprising contacting nucleic acid molecules representative of expressed polynucleotides in cells of the test plant with at least one nucleic acid probe under conditions suitable for selective hybridization to a complementary nucleotide sequence,

20

wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1699-1969, or a nucleotide sequence complementary thereto,

25

whereby

detecting selective hybridization of at least one nucleic acid probe, or detecting a change in a level of selective hybridization as compared to a level of selective hybridization obtained using nucleic acid molecules representative of expressed polynucleotides in cells of a plant known not have been exposed to a cold stress and an osmotic stress,

30

indicates that the test plant has been exposed to a cold stress and an osmotic stress, and

whereby an absence of selective hybridization of at least one nucleic acid probe indicates that the test plant has not been exposed to a cold stress and an osmotic stress.

- 5 31. A method for determining whether a test plant has been exposed to a cold stress and a saline stress, the method comprising contacting nucleic acid molecules representative of expressed polynucleotides in cells of the test plant with at least one nucleic acid probe under conditions suitable for selective hybridization to a complementary nucleotide sequence,
- 10 wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1970-2226, or a nucleotide sequence complementary thereto,
- whereby
- detecting selective hybridization of at least one nucleic acid probe, or
- 15 detecting a change in a level of selective hybridization as compared to a level of selective hybridization obtained using nucleic acid molecules representative of expressed polynucleotides in cells of a plant known not have been exposed to a cold stress and a saline stress,
- indicates that the test plant has been exposed to a cold stress and a
- 20 saline stress, and
- whereby an absence of selective hybridization of at least one nucleic acid probe indicates that the test plant has not been exposed to a cold stress and a saline stress.
- 25 32. A method for determining whether a test plant has been exposed to an osmotic stress and a saline stress, the method comprising contacting nucleic acid molecules representative of expressed polynucleotides in the test plant with at least one nucleic acid probe under conditions suitable for selective hybridization to a complementary nucleotide sequence,
- 30 wherein the probe comprises at least 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:2586-2703, or a nucleotide sequence complementary thereto,

whereby

detecting selective hybridization of at least one nucleic acid probe, or
detecting a change in a level of selective hybridization as compared to
a level of selective hybridization obtained using nucleic acid molecules
5 representative of expressed polynucleotides in cells of a plant known not have
been exposed to an osmotic stress and a saline stress,
indicates that the test plant has been exposed to an osmotic stress and a
saline stress, and

whereby an absence of selective hybridization of at least one nucleic acid
10 probe indicates that the test plant has not been exposed to an osmotic stress and a
saline stress.

33. A method for determining whether a test plant has been exposed to a cold
stress, a saline stress and an osmotic stress, the method comprising contacting nucleic
15 acid molecules representative of expressed polynucleotides in cells of the test plant
with a plurality of nucleic acid probes under conditions suitable for selective
hybridization to a complementary nucleotide sequence,

wherein the probe comprises at least 15 nucleotides of a nucleotide sequence
as set forth in any of SEQ ID NOS:1262-1698, or a nucleotide sequence
20 complementary thereto,

whereby

detecting selective hybridization of at least one nucleic acid probe, or
detecting a change in a level of selective hybridization as compared to
a level of selective hybridization obtained using nucleic acid molecules
25 representative of expressed polynucleotides in cells of a plant known not have
been exposed to a cold stress, a saline stress, and an osmotic stress,
indicates that the test plant has been exposed to a cold stress, a saline
stress and an osmotic stress, and

whereby an absence of selective hybridization of at least one nucleic acid
30 probe indicates that the test plant has not been exposed to a cold stress, a saline stress
and an osmotic stress.

34. A method for determining whether a test plant has been exposed to a cold stress, the method comprising detecting a level of expression of at least one polynucleotide comprising a nucleotide sequence as set forth in SEQ ID NOS:1-155, 157-229, 230-232, 234-557, 559-572, 574-605, 607-634, 636-634, 636-786, 788-812, and 814-1261 in cells of the test plant,

wherein

detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress, or

10 detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a cold stress,

indicates the test plant has been exposed to a cold stress, or

wherein

15 detecting a level of expression that is less than at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress, or

detecting a level of expression that is at least two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a cold stress,

20 indicates the test plant has not been exposed to a cold stress.

35. A method for determining whether a test plant has been exposed to a saline stress, the method comprising detecting a level of expression of at least one polynucleotide comprising a nucleotide sequence as set forth in SEQ ID NOS:2226-2427 in cells of the test plant,

25

wherein

detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a saline stress, or

5 detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a saline stress,

indicates the test plant has been exposed to a saline stress, or wherein

10 detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a saline stress, or

15 detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a saline stress,

indicates the test plant has not been exposed to a saline stress.

36. A method for determining whether a test plant has been exposed to an osmotic stress, the method comprising detecting a level of expression of at least one polynucleotide comprising a nucleotide sequence as set forth in SEQ ID NOS:2428-2585 in cells of the test plant,

wherein

25 detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to an osmotic stress, or

detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to an osmotic stress,

30 indicates the test plant has been exposed to a osmotic stress, or

wherein

detecting a level of expression that is less than about two-fold different from level of expression of the at least one polynucleotide in cells of a plant not exposed to an osmotic stress, or

5 detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to an osmotic stress,

indicates the test plant has not been exposed to a osmotic stress.

10 37. A method for determining whether a test plant has been exposed to a cold stress and an osmotic stress, the method comprising detecting a level of expression of at least one polynucleotide comprising a nucleotide sequence as set forth in SEQ ID NOS:1699-1969 in cells of the test plant,

wherein

15 detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress and an osmotic stress, or

 detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant
20 known to be exposed to a cold stress and an osmotic stress,

indicates the test plant has been exposed to a cold stress and an osmotic stress, or

wherein

 detecting a level of expression that is less than about two-fold different
25 from as a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress and an osmotic stress, or

 detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a cold stress and an osmotic stress,

30 indicates the test plant has not been exposed to a cold stress and an osmotic stress.

555

38. A method for determining whether a test plant has been exposed to a cold stress and a saline stress, the method comprising detecting a level of expression of at least one polynucleotide comprising a nucleotide sequence as set forth in SEQ ID NOS:1970-2226 in cells of the test plant,

5 wherein

detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress and a saline stress, or

10 detecting a level of expression that is less than about two-fold different from as a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a cold stress and a saline stress,

indicates the test plant has been exposed to a cold stress and a saline stress, or

wherein

15 detecting a level of expression that is less than about two-fold different from as a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress and a saline stress, or

20 detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a cold stress and a saline stress,

indicates the test plant has not been exposed to a cold stress and a saline stress.

39. A method for determining whether a test plant has been exposed to a saline stress and an osmotic stress, the method comprising detecting a level of expression of at least one polynucleotide comprising a nucleotide sequence as set forth in SEQ ID NOS:2586-2703 in cells of the test plant,

wherein

30 detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a saline stress and an osmotic stress, or

detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a saline stress and an osmotic stress,

5 indicates the test plant has been exposed to a saline stress and an osmotic stress, or wherein

detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a saline stress and an osmotic stress, or

10 detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to saline stress and an osmotic stress,

indicates the test plant has not been exposed to a saline stress and an osmotic stress.

15

40. A method for determining whether a test plant has been exposed to a cold stress, the method comprising detecting a level of expression of at least one polynucleotide comprising a nucleotide sequence as set forth SEQ ID NOS:1-155, 157-229, 230-232, 234-557, 559-572, 574-605, 607-634, 636-634, 636-786, 788-812, and 814-1261 in cells of the test plant,

20

wherein

detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress, or

25

detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a cold stress,

indicates the test plant has been exposed to a cold stress, or

wherein

30

detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress, or

detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a cold stress,

indicates the test plant has not been exposed to a cold stress.

5

41. A method for determining whether a test plant has been exposed to a cold stress, a saline stress and an osmotic stress, the method comprising detecting a level of expression of at least one polynucleotide comprising a nucleotide sequence as set forth in SEQ ID NOS:1262-1698 in cells of the test plant,

10

wherein

detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress, a saline stress and an osmotic stress, or

15

detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a cold stress, a saline stress and an osmotic stress,

indicates the test plant has been exposed to a cold stress, a saline stress and an osmotic stress, or

wherein

20

detecting a level of expression that is less than about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant not exposed to a cold stress, a saline stress and an osmotic stress, or

25

detecting a level of expression that is at least about two-fold different from a level of expression of the at least one polynucleotide in cells of a plant known to be exposed to a cold stress, a saline stress and an osmotic stress,

indicates the test plant has not been exposed to a cold stress, a saline stress and an osmotic stress.

42. A method of producing a transgenic plant comprising plant cells that exhibit altered responsiveness to at least one stress condition, the method comprising introducing a polynucleotide portion of a plant stress-regulated gene into a plant cell genome, wherein the polynucleotide portion of the stress-regulated gene does not
5 comprise a nucleotide sequence as set forth in any of SEQ ID NOS:156, 229, 233, 558, 573, 606, 635, 787, 813, 1263, 1386, 1391, 1405, 1445, 1484, 1589, 1609, 1634, 1726, 1866, 1918 or 1928, whereby the polynucleotide portion of the plant stress-regulated gene modulates a response of the plant cells to at least one stress condition, thereby producing a transgenic plant comprising plant cells that exhibit altered
10 responsiveness to the stress condition.

43. The method of claim 42, wherein the stress condition is cold stress, and wherein the polynucleotide portion of a plant stress-regulated gene comprises a nucleotide sequence as set forth in any of SEQ ID NOS:1-155, 157-228, 230-232,
15 234-557, 559-572, 574-605, 607-634, 636-786, 788-812, 814-1261, 2704-2855, 2857-2928, 2930-2932, 2934-3256, 3258-3271, 3273-3304, 3306-3323, 3325-3333, 3335-3485, 3487-3511, and 3313-3955.

44. The method of claim 42, wherein the stress condition is saline stress, and
20 wherein the polynucleotide portion of a plant stress-regulated gene comprises a nucleotide sequence as set forth in any of SEQ ID NOS:2226-2427 and 4910-5107.

45. The method of claim 42, wherein the stress condition is osmotic stress, and wherein the polynucleotide portion of a plant stress-regulated gene comprises a
25 nucleotide sequence as set forth in any of SEQ ID NOS:2428-2585 and 5108-5263.

46. A method of producing a transgenic plant comprising plant cells that exhibit altered responsiveness to a combination of at least two stress conditions, the method comprising introducing a polynucleotide portion of a plant stress-regulated gene into a plant cell genome, whereby the polynucleotide portion of the plant stress-regulated gene modulates a response of the plant cells to a combination of at least two stress conditions, thereby producing a transgenic plant comprising plant cells that exhibit altered responsiveness to the stress conditions.

47. The method of claim 46, wherein the combination of at least two stress conditions is a combination of cold stress and osmotic stress, and wherein the polynucleotide portion of the plant stress-regulate gene comprises a nucleotide sequences as set forth in any of SEQ ID NOS:1669-1969 and 4389-4654.

48. The method of claim 46, wherein the combination of at least two stress conditions is a combination of cold stress and osmotic stress, and wherein the polynucleotide portion of the plant stress-regulate gene comprises a nucleotide sequences as set forth in any of SEQ ID NOS:1699-1725, 1727-1865, 1867-1917, 1919-1927, 1929-1969, 4389-4414, 4416-4552, 4554-4602, 4604-4612, and 4613-4654.

49. The method of claim 46, wherein the combination of at least two stress conditions is a combination of cold stress and saline stress, and wherein the polynucleotide portion of the plant stress-regulate gene comprises a nucleotide sequences as set forth in any of SEQ ID NOS:1970-2226 and 4655-4909.

50. The method of claim 46, wherein the combination of at least two stress conditions is a combination of osmotic stress and saline stress, and wherein the polynucleotide portion of the plant stress-regulate gene comprises a nucleotide sequences as set forth in any of SEQ ID NOS:2586-2703 and 5264-5379.

51. The method of claim 46, wherein the combination of at least two stress conditions is a combination of cold stress, osmotic stress and saline stress, and wherein the polynucleotide portion of the plant stress-regulate gene comprises a nucleotide sequences as set forth in any of SEQ ID NOS:1262-1698 and 3956-4388.

5

52. The method of claim 46, wherein the combination of at least two stress conditions is a combination of cold stress, osmotic stress and saline stress, and wherein the polynucleotide portion of the plant stress-regulate gene comprises a nucleotide sequences as set forth in any of SEQ ID NOS:1262, 1264-1386, 1387-1390,

10 1392-1404, 1406-1444, 1446-1483, 1485-1588, 1590-1608, 1610-1633, 1634-1698, 3956, 3958-4078, 4080-4097, 4099-4136, 4138-4175, 4177-4279, 4281-4299, 4301-4324, and 4326-4388.

53. The method of any of claim 42 to 52, wherein the polynucleotide portion
15 of the plant stress-regulated gene encodes a stress-regulated polypeptide or functional peptide portion thereof.

54. The method of claim 53, wherein the stress-regulated polypeptide or
functional peptide portion thereof increases the stress tolerance of the transgenic
20 plant.

55. The method of claim 53, wherein the stress-regulated polypeptide or
functional peptide portion thereof decreases the stress tolerance of the transgenic
plant.

25

56. The method of claim 53, wherein the polynucleotide portion of the plant stress-regulated gene is operatively linked to a heterologous promoter.

57. The method of any of claim 42 to 52, wherein the polynucleotide portion
30 of the plant stress-regulated gene comprises a stress-regulated regulatory element.

58. The method of claim 57, wherein, upon introducing the stress-regulated regulatory element into the plant cell, the regulatory element integrates into the plant cell genome in a site-specific manner.

5 59. The method of claim 58, wherein, upon integrating into the plant cell genome, the regulatory element is operatively linked to a heterologous nucleotide sequence, which can be expressed in response to a stress condition specific for the regulatory element.

10 60. The method of claim 57, wherein the plant stress-regulated regulatory element is a mutant regulatory element, which is not responsive to the stress condition, whereby upon integrating into the plant cell genome, the mutant regulatory element disrupts an endogenous stress-regulated regulatory element of a plant stress-regulated gene, thereby altering the responsiveness of the plant stress-regulated gene
15 to the stress condition.

61. The method of any of claim 42 to 60, wherein the stress is an abiotic stress.

20 62. The method of claim 61, wherein the abiotic stress is selected from the group consisting of an abnormal level of cold, osmotic pressure, salinity, and a combination thereof.

25 63. The method of claim 57, wherein the stress-regulated regulatory element is operatively linked to a polynucleotide encoding a detectable marker.

64. A transgenic plant produced by the method of any of claims 42 to 63.

30 65. A plant cell from the transgenic plant of claim 64, wherein said plant cell exhibits altered responsiveness to the stress condition or stress conditions.

66. A seed produced by the transgenic plant of claim 64.

67. A cDNA or genomic DNA library prepared from the transgenic plant of claim 64, or from a plant cell from said transgenic plant, wherein said plant cell exhibits altered responsiveness to the stress condition.

- 5 68. A method for monitoring a population of plants for exposure to a stress condition or combination of stress conditions, the method comprising:
- a) introducing into the population of a plants a sentinel plant, wherein said sentinel plant is a transgenic plant of claim 64, which comprises plant cells containing a stress-regulated regulatory element is operatively linked to a polynucleotide encoding a detectable marker; and
 - 10 b) examining the sentinel plant for expression of the detectable marker, which is indicative of exposure of the population of plants to a stress condition or combination of stress conditions,
- thereby monitoring the population of plants for exposure to a stress condition
- 15 or combination of stress conditions.

69. The method of claim 68, wherein said stress condition or combination of stress conditions is an abiotic stress condition or combination of abiotic stress conditions.

20

70. The method of claim 68 or 69, wherein said stress condition or combination of stress conditions is cold stress, osmotic stress, saline stress, and a combination thereof.

25 71. The method of any of claims 68 to 70, wherein the stress condition is a cold stress condition, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:2704-3955.

72. The method of any of claims 68 to 70, wherein the stress condition is a cold stress condition, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:2704-2855, 2857-2928, 2930-2932, 2934-3256, 3258-3271, 3273-3304, 3306-3323, 3325-3333, 3335-3485, 3487-3511, and 3313-3955.

73. The method of any of claims 68 to 70, wherein the stress condition is a saline stress condition, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:4910-5107.

10

74. The method of any of claims 68 to 70, wherein the stress condition is an osmotic stress condition, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:5108-5263.

15

75. The method of any of claims 68 to 70, wherein the combination of stress conditions is cold stress and osmotic stress, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:4389-4654.

76. The method of any of claim 68 to 70, wherein the combination of stress conditions is a cold stress and an osmotic stress, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:4389-4414, 4416-4552, 4554-4602, 4604-4612, and 4613-4654.

20

77. The method of any of claims 68 to 70, wherein the combination of stress condition is a cold stress and a saline stress, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:4655-5909.

25

78. The method of any of claims 68 to 70, wherein the combination of stress conditions is an osmotic stress and a saline stress, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:5264-5379.

30

79. The method of any of claims 68 to 70, wherein the combination of stress conditions is a cold stress, an osmotic stress, and a saline stress, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:3956-4388.

5

80. The method of any of claims 68 to 70, wherein the combination of stress conditions is a cold stress, an osmotic stress, and a saline stress, and wherein the regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:3956, 3958-4078, 4080-4097, 4099-4136, 4138-4175, 4177-4279, 4281-4299, 10 4301-4324, and 4326-4388.

81. The method of any of claims 68 to 80, wherein the detectable marker is visibly detectable.

15 82. The method of any of claims 68 to 80, wherein said detectable marker comprises a luminescent detectable marker.

83. The method of any of claims 68 to 80, wherein said detectable marker comprises a fluorescent detectable marker.

20

84. The method of claim 83, wherein said fluorescent detectable marker comprises a green fluorescent protein, a yellow fluorescent protein, a cyan fluorescent protein, a red fluorescent protein, or an enhanced or modified form thereof.

25 85. A method of selecting a plant having an altered resistance to an abiotic stress condition or a combination of abiotic stress conditions, the method comprising:

a) contacting nucleic acid molecules representative of expressed polynucleotides in a plant cell of a plant to be examined for having an altered resistance to an abiotic stress with a nucleic acid probes that selectively 30 hybridizes under stringent conditions to a plant stress-regulated gene comprising a nucleotide sequence as set forth in any of SEQ ID NO:1-5379;

565

- b) detecting a level of selective hybridization of the nucleic acid probes to a nucleic acid molecule representative of an expressed polynucleotide in the plant cell, wherein the level of selective hybridization corresponds to the level of the expressed polynucleotide in the plant cell, which is indicative of resistance of the plant to an abiotic stress; and
- 5 c) selecting a plant having a level of expression of a polynucleotide indicative of altered resistance to an abiotic stress condition.

86. The method of claim 85, wherein the abiotic stress condition is cold stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1-1261 and 2704-3955.

10

87. The method of claim 85, wherein the abiotic stress condition is cold stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1-155, 157-228, 230-232, 234-557, 559-572, 574-605, 607-634, 636-786, 788-812, 814-1261, 2704-2855, 2857-2928, 2930-2932, 2934-3256, 3258-3271, 3273-3304, 3306-3323, 3325-3333, 3335-3485, 3487-3511, and 3313-3955.

15

88. The method of claim 85, wherein the abiotic stress condition is saline stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:2226-2427 and 4910-5107.

20

89. The method of claim 85, wherein the abiotic stress condition is osmotic stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:2428-2585 and 5108-5263.

25

90. The method of claim 85, wherein the combination of abiotic stress conditions is a combination of cold stress and osmotic stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1669-1969 and 4389-4654.

30

91. The method of claim 85, wherein the combination of abiotic stress conditions is a combination of cold stress and osmotic stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide sequence as set forth in any of SEQ ID NOS:1699-1725, 1727-1865, 1867-1917, 1919-1927,
5 1929-1969, 4389-4414, 4416-4552, 4554-4602, 4604-4612, and 4613-4654.

92. The method of claim 85, wherein the combination of abiotic stress conditions is a combination of cold stress and saline stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide sequence as set forth in
10 any of SEQ ID NOS:1970-2226 and 4655-4909.

93. The method of claim 85, wherein the combination of abiotic stress conditions is a combination of osmotic stress and saline stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide sequence as set
15 forth in any of SEQ ID NOS:2586-2703 and 5264-5379.

94. The method of claim 85, wherein the combination of abiotic stress conditions is a combination of cold stress, osmotic stress and saline stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide
20 sequence as set forth in any of SEQ ID NOS:1262-1698 and 3956-4388.

95. The method of claim 85, wherein the combination of abiotic stress conditions is a combination of cold stress, osmotic stress and saline stress, and wherein the nucleic acid probe comprises at least about 15 nucleotides of a nucleotide
25 sequence as set forth in any of SEQ ID NOS:1262, 1264-1386, 1387-1390, 1392-1404, 1406-1444, 1446-1483, 1485-1588, 1590-1608, 1610-1633, 1634-1698, 3956, 3958-4078, 4080-4097, 4099-4136, 4138-4175, 4177-4279, 4281-4299, 4301-4324, and 4326-4388.

96. A method of modulating the responsiveness of a plant cell to a stress condition, the method comprising introducing a polynucleotide portion of a plant stress-regulated gene into the plant cell, wherein said gene comprises a nucleotide sequence of a polynucleotide as set forth in any of SEQ ID NOS:1-155, 157-228,
5 230-232, 234-557, 559-572, 574-605, 607-634, 636-786, 788-812, 814-1262, 1264-1386, 1387-1390, 1392-1404, 1406-1444, 1446-1483, 1485-1588, 1590-1608, 1610-1633, 1634-1725, 1727-1865, 1867-1917, 1919-1927, 1929-2855, 2857-2928, 2930-2932, 2934-3256, 3258-3271, 3273-3304, 3306-3323, 3325-3333, 3335-3485, 3487-3511, 3313-3956, 3958-4078, 4080-4097, 4099-4136, 4138-4175, 4177-4279,
10 4281-4299, 4301-4324, 4326-4414, 4416-4552, 4554-4602, and 4604-5379, thereby modulating the responsiveness of the plant cell to a stress condition.

97. The method of claim 96, wherein the responsiveness of the plant cell is increased upon exposure to the stress condition.
15

98. The method of claim 97, wherein increased responsiveness of the plant cell increases the stress tolerance of the plant cell to the stress condition.

99. The method of claim 96, wherein the responsiveness of the plant cell is decreased upon exposure to the stress condition.
20

100. The method of claim 99, wherein decreased responsiveness of the plant cell increases the stress tolerance of the plant cell to the stress condition.

101. The method of claim 96, wherein the polynucleotide portion of the plant stress-regulated gene integrates into the genome of the plant cell, thereby modulating the responsiveness of the plant cell to the stress condition.
25

102. The method of claim 96, wherein the polynucleotide portion of the plant stress-regulated gene encodes a stress-regulated polypeptide or functional peptide portion thereof.
30

103. The method of claim 102, wherein the stress-regulated polypeptide or functional peptide portion thereof increases the responsiveness of the plant cell to the stress condition.

5 104. The method of claim 102, wherein the polynucleotide portion of the plant stress-regulated gene is operatively linked to a heterologous promoter.

105. The method of claim 102, wherein the polynucleotide portion of the plant stress-regulated gene contains a mutation, whereby upon integrating into the
10 plant cell genome, the polynucleotide disrupts an endogenous plant stress-regulated gene, thereby modulating the responsiveness of said plant cell to the stress condition.

106. The method of claim 105, wherein the endogenous plant stress-regulated gene encodes a maladaptive stress-regulated polypeptide, and wherein said plant cell
15 exhibits increased tolerance to the stress condition.

107. The method of claim 96, wherein the polynucleotide portion of the plant stress-regulated gene comprises a stress-regulated gene regulatory element.

20 108. The method of claim 107, wherein, the regulatory element is operatively linked to a heterologous nucleotide sequence, which, upon expression from the regulatory element in response to a stress condition, modulates the responsiveness of the plant cell to the stress condition.

25 109. The method of claim 108, wherein the heterologous nucleotide sequence encodes a stress-inducible transcription factor.

110. The method of claim 109, wherein the transcription factor is DREB1A.

111. The method of claim 108, wherein the heterologous nucleotide sequence encodes a polynucleotide specific for a plant stress-regulated gene, said polynucleotide selected from the group consisting of an antisense molecule, a ribozyme, and a triplexing agent, which, upon expression in the plant cell, reduces or inhibits expression of a stress-regulated polypeptide encoded by the gene, thereby modulating the responsiveness of the plant cell to a stress condition.

112. The method of claim 108, wherein the heterologous nucleotide sequence encodes a recombinant polypeptide comprising a zinc finger domain and a transcription effector domain.

113. The method of claim 112, wherein the transcription effector domain is a transcription activator domain.

114. The method of claim 96, wherein the stress condition is cold stress, osmotic stress, saline stress, or a combination thereof.

115. A method of expressing a heterologous nucleotide sequence in a plant cell, the method comprising introducing into the plant cell a plant stress-regulated regulatory element operatively linked to the heterologous nucleotide sequence, wherein said regulatory element comprises a nucleotide sequence as set forth in any of SEQ ID NOS:2704-2855, 2857-2928, 2930-2932, 2934-3256, 3258-3271, 3273-3304, 3306-3323, 3325-3333, 3335-3485, 3487-3511, 3313-3956, 3958-4078, 4080-4097, 4099-4136, 4138-4175, 4177-4279, 4281-4299, 4301-4324, 4326-4414, 4416-4552, 4554-4602, and 4604-5379, whereby, upon exposure of the plant cell to stress condition, the heterologous nucleotide sequence is expressed in the plant cell.

116. The method of claim 117, wherein the heterologous nucleotide sequence encodes a selectable marker.

30

117. The method of claim 117, wherein the heterologous nucleotide sequence encodes a polypeptide that improves the nutritional value of the plant cell.

118. The method of claim 117, wherein the heterologous nucleotide sequence encodes a polypeptide that improves the ornamental value of the plant cell.

5 119. A method of modulating the activity of a biological pathway in a plant cell involving a plant stress-regulated polypeptide, the method comprising introducing a polynucleotide portion of a plant stress-regulated gene into the plant cell, wherein the plant stress-regulated gene comprises a nucleotide sequence as set forth in any of SEQ ID NOS:1-155, 157-228, 230-232, 234-557, 559-572, 574-605, 607-634,
10 636-786, 788-812, 814-1262, 1264-1386, 1387-1390, 1392-1404, 1406-1444, 1446-1483, 1485-1588, 1590-1608, 1610-1633, 1634-1725, 1727-1865, 1867-1917, 1919-1927, 1929-2855, 2857-2928, 2930-2932, 2934-3256, 3258-3271, 3273-3304, 3306-3323, 3325-3333, 3335-3485, 3487-3511, 3313-3956, 3958-4078, 4080-4097, 4099-4136, 4138-4175, 4177-4279, 4281-4299, 4301-4324, 4326-4414, 4416-4552,
15 4554-4602, and 4604-5379, thereby modulating the activity of the biological pathway.

120. A plant cell obtained by any of claims 96 to 121.

121. A plant comprising the plant cell of claim 122.

20

122. A method of identifying a polynucleotide that modulates a stress response in a plant cell, the methods comprising:

- 25 a) contacting an array of probes representative of a plant cell genome and nucleic acid molecules expressed in plant cell exposed to the stress;
- b) detecting a nucleic acid molecule that is expressed at a level different from a level of expression in the absence of the stress;
- c) introducing the nucleic acid molecule of step b) into a plant cell; and
- d) detecting a modulated response of the plant cell of step c) to a stress, thereby identifying a polynucleotide that modulates a stress response in
30 a plant cell.

123. The method of claim 124, wherein the stress is an abiotic stress.

124. The method of claim 125, wherein the abiotic stress is selected from the group consisting of an abnormal level of cold, osmotic pressure, and salinity.

5

125. The method of claim 124, wherein expression of the nucleic acid molecule increases the tolerance of the plant cell to the stress.

126. The method of claim 124, wherein, in step b), the nucleic acid molecule is expressed at a level that is less than the level of expression in the absence of the stress.

10

127. A transgenic plant, which contains a transgene comprising a polynucleotide portion of plant stress-regulated gene, wherein the gene comprises a nucleotide sequence as set forth in any of SEQ ID NOS:1-155, 157-228, 230-232, 234-557, 559-572, 574-605, 607-634, 636-786, 788-812, 814-1262, 1264-1386, 1387-1390, 1392-1404, 1406-1444, 1446-1483, 1485-1588, 1590-1608, 1610-1633, 1634-1725, 1727-1865, 1867-1917, 1919-1927, 1929-2855, 2857-2928, 2930-2932, 2934-3256, 3258-3271, 3273-3304, 3306-3323, 3325-3333, 3335-3485, 3487-3511, 3313-3956, 3958-4078, 4080-4097, 4099-4136, 4138-4175, 4177-4279, 4281-4299, 4301-4324, 4326-4414, 4416-4552, 4554-4602, and 4604-5379.

15

20

128. The transgenic plant of claim 129, wherein the transgenic plant exhibits altered responsiveness to a stress condition as compared to a corresponding wild-type plant.

25

129. The transgenic plant of claim 130, wherein the transgene disrupts an endogenous stress-regulated gene in the plant, thereby reducing or inhibiting expression of the gene in response to a stress condition.

30

130. The transgenic plant of claim 130, wherein the plant exhibits increased tolerance to a stress condition.

131. The transgenic plant of claim 130, wherein the plant exhibits decreased tolerance to a stress condition.

5 132. The transgenic plant of any of claims 129 to 133, wherein the transgene comprises a coding sequence of a plant stress-regulated gene.

133. The transgenic plant of claim 134, wherein the coding sequence is operatively linked to a heterologous regulatory element.

10

134. The transgenic plant of claim 135, wherein the regulatory element is a constitutively active regulatory element.

15 135. The transgenic plant of claim 135, wherein the regulatory element is an regulated regulatory element.

136. The transgenic plant of claim 135, wherein the regulatory element is a tissue specific or phase specific regulatory element.

20 137. The transgenic plant of any of claims 129 to 131, wherein the transgene comprises a plant stress-regulated regulatory element operatively linked to a heterologous nucleotide sequence.

25 138. The transgenic plant of claim 139, wherein the transgenic plant expresses a polypeptide encoded by the heterologous nucleotide sequence.

139. The transgenic plant of claim 140, wherein the polypeptide improves the nutritional value or ornamental value of the plant.

30 140. The transgenic plant of any of claims 129 to 141, wherein the plant comprises multiple transgenes.

141. The transgenic plant of claim 142, wherein the multiple transgenes comprise multiple copies of the same transgene or comprise two or more different transgenes.

5 142. A plant stress-regulated gene regulatory element, wherein the gene comprises a nucleotide sequence as set forth in any of SEQ ID NOS:1-155, 157-228, 230-232, 234-557, 559-572, 574-605, 607-634, 636-786, 788-812, 814-1262, 1264-1386, 1387-1390, 1392-1404, 1406-1444, 1446-1483, 1485-1588, 1590-1608, 1610-1633, 1634-1725, 1727-1865, 1867-1917, 1919-1927, 1929-2855, 2857-2928,
10 2930-2932, 2934-3256, 3258-3271, 3273-3304, 3306-3323, 3325-3333, 3335-3485, 3487-3511, 3313-3956, 3958-4078, 4080-4097, 4099-4136, 4138-4175, 4177-4279, 4281-4299, 4301-4324, 4326-4414, 4416-4552, 4554-4602, and 4604-5379.

 143. The plant stress-regulated gene regulatory element of claim 144,
15 comprising a nucleotide sequence as set forth in any of SEQ ID NOS: 2704-2855, 2857-2928, 2930-2932, 2934-3256, 3258-3304, 3306-3323, 3325-3333, 3335-3485, 3487-3511, 3513-3956, 3958-4078, 4080-4097, 4099-4136, 4138-4175, 4177-4279,, 4281-4299, 4301-4324, 4326-4414, 4416-4552, 4554-4602, 4604-4612, and 4614-5379, or a nucleotide sequence substantially similar thereto.

20 144. A method of identifying an agent that modulates the activity of the plant stress-regulated regulatory element of claim 144 or claim 145, the method comprising:
 a) contacting the regulatory element with an agent suspected of having the ability to modulate the activity of the regulatory element; and
25 b) detecting a change in the activity of the regulatory element, thereby identifying an agent that modulates the activity of the plant stress-regulated regulatory element.

 145. The method of claim 146, wherein the regulatory element can be
30 operatively linked to a heterologous nucleotide sequence.

146. The method of claim 147, wherein the heterologous nucleotide sequence encodes a reporter molecule.

147. The method of any of claims 146 to 148, which is *in vitro* in a plant cell-free system, in a plant cell in culture, or in a plant *in situ*.

148. The method of claim 149, wherein the plant is a transgenic plant, into which the plant stress-regulated regulatory element has been introduced.

149. The method of any of claims 146 to 150, wherein the agent is a stress mimic.

150. A method of modulating a stress-regulated response in a plant cell, the method comprising expressing in the plant cell a recombinant polypeptide that interacts specifically with a plant stress-regulated regulatory element of claim 144 or claim 145, thereby modulating a stress-regulated response in the plant.

151. The method of claim 152, wherein the recombinant polypeptide comprises a zinc finger domain, which specifically interacts with the stress-regulated regulatory element, and a transcription effector domain, which effects expression of the regulatory element.

152. The method of claim 153, wherein the effector domain is a transcription activation domain.

153. The method of claim 153, wherein the effector domain is a transcription repressor domain.

575

154. A method for identifying a polynucleotide involved in a stress response of a plant, the method comprising:

5 a) contacting nucleic acid molecules representative of expressed polynucleotides in plant cells of a plant exposed to a stress condition or combination of stress conditions with an array of probes representative of the plant cell genome; and

10 b) detecting a nucleic acid molecule that exhibits at least a two-fold change in the level of expression as compared to the level of the nucleic acid molecule in a corresponding plant cell of a plant that was not exposed to the stress condition, thereby identifying a polynucleotide involved in a stress response of the plant.

15 155. The method of claim 156, comprising identifying a plurality of polynucleotides involved in the stress response in the plant.

156. The method of claim 156 or 157, further comprising isolating the polynucleotide or plurality of polynucleotides.

20 157. A computer readable medium having stored thereon computer executable instructions for performing a method comprising:

a) receiving data on expression in a cell of a plant of a nucleic acid molecule having at least 70% sequence identity to a nucleotide sequence comprising any of SEQ ID NO. 1-5379; and

25 b) comparing the data on expression of the nucleic acid molecule with data on expression of the nucleic acid in a cell of a plant that has not been exposed to an abiotic stress, of a plant that has been exposed to an abiotic stress condition or combination of abiotic stress conditions, or of a combination of such plants.

158. The computer readable medium of claim 159, wherein the nucleic acid molecule comprises one of a plurality of nucleic acid molecules, and wherein the computer executable instructions are capable performing receiving and comparing of any or all of the plurality of nucleic acid molecules.

5

159. A computer-readable medium having stored thereon a data structure comprising:

sequence data for at least one nucleic acid molecule having at least 70% nucleic acid sequence identity to a polynucleotide having a nucleotide sequence as set forth in any of SEQ ID NO. 1-5379 or a nucleotide sequence complementary thereto; and

10

a module receiving the nucleic acid molecule sequence data, which compares the nucleic acid molecule sequence data to a least one other nucleic acid sequence.

(54) Title: STRESS-REGULATED GENES OF PLANTS, TRANSGENIC PLANTS CONTAINING SAME, AND METHODS OF USE

(57) Abstract: The present invention relates to clusters of plant genes that are regulated in response to one or more stress conditions. The present invention also relates to isolated plant stress-regulated genes, including portions thereof comprising a coding sequence or a regulatory element, and to consensus sequences comprising a plant stress-regulated regulatory element. In addition, the invention relates to a recombinant polynucleotide, which includes a plant stress-regulated gene, or functional portion thereof, operatively linked to a heterologous nucleotide sequence. The invention further relates to a transgenic plant, which contains a plant stress-regulated gene or functional portion thereof that was introduced into a progenitor cell of the plant. In addition, the invention relates to methods of using a plant stress-regulated gene to confer upon a plant a selective advantage to a stress condition. The invention also relates to a method of identifying an agent that modulates the activity of a plant stress-regulated regulatory element.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US 01/26685

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☒ Claims Nos.: 152-155
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
claims 1-6, 16-19, 22, 34, 40, 42, 43, 57-70, 81-87, 96-114, 121-144, 146-151, 156-161 all partially

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

Invention 1: claims: 1-6,16-19,22,34,40,42,43,
57-70, 81-87,96-114,121-144,146-151,
156-161 all partially

A method of identifying a stress condition to which a plant cell has been exposed comprising a polynucleotide with SEQ ID NO: 1. A method for determining whether a test plant has been exposed to an abiotic stress, a method of producing a transgenic plant, a transgenic plant, a plant, a plant cell, a seed, a cDNA or genomic library, a method for monitoring a population of plants, a method of selecting a plant having an altered resistance to an abiotic stress condition, a method of modulating the responsiveness of a plant cell to a stress condition, a method of modulating the activity of a biological pathway in a plant cell, a method of identifying a polynucleotide that modulates a stress response in a plant cell, a plant stress-regulated gene regulatory element, a method of identifying an agent that modulates the activity of a plant stress-regulated element, a method for identifying a polynucleotide involved in a stress response of a plant, a computer readable medium having stored thereon computer executable instructions or a data structure comprising said polynucleotide.

Invention 2-5379: claims 1-151,
156-161 insofar as applicable; all partially

same as invention 2 but comprising a polynucleotide sequence in the order as given in the claims (invention 2 is limited to SEQ ID NO: 2 and invention 5379 is limited to SEQ ID NO: 5379).

Continuation of Box I.2

Claims Nos.: 152-155

Present claims 152-155 relate a product/compound defined by reference to a desirable characteristic or property, namely a polypeptide that interacts with a plant stress-regulated regulatory element.

The claims cover all products/compounds having this characteristic or property, whereas the application provides support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT for only a very limited number of such products/compounds. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Independent of the above reasoning, the claims also lack clarity (Article 6 PCT). An attempt is made to define the product/compound by reference to a result to be achieved. Again, this lack of clarity in the present case is such as to render a meaningful search over the whole of the claimed scope impossible. Consequently, no search has been carried out.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
